Air Pollution Control Technology

Manual

March 1998

Overseas Environmental Cooperation Center
Preface

Japan has manifested, both domestically and internationally, a policy of strengthening support for environmental conservation in developing countries, and it is hoped that Japan will play a major role in technological cooperation by translating this policy into more “visible assistance” and dispatching capable personnel to developing countries so that specialists from both Japan as well as developing countries will be able to collaborate in problem solving.

A distinguishing feature of the environmental problems in developing countries is that environmental deterioration on a global scale is occurring at the same time as serious environmental pollution like that Japan experienced during its high growth period. In addition, regardless of the present situation, the pressures involved in the economic development that these countries are seeking is growing all the more while they continue to neglect paying sufficient consideration to the environment.

When Japanese specialists are dispatched to developing countries that are facing such circumstances, they are often questioned about a wide range of issues concerning environmental conservation which are not limited to their personal fields of specialty. An obvious need has arisen to provide materials with such a wide range of content in order to support these types of specialists.

With this situation in mind, extensive materials on conservation technology, within the field of air quality conservation, which has become a serious issue and here has been much demand for technology transfer from developing countries, have been put together in this “Air Pollution Control Technology Manual”. It would give me great pleasure for this manual to be utilized not only for the transfer of technology concerning the environmental field from Japan to these developing countries but also as research material for the training of international environmental cooperation specialists.

This manual was written by persons of learning and experience in the field of air pollution control in Japan, and it was put together by various specialists in each field with advice from the members of The Air Pollution Control Technology Manual Committee. I would also like to thank Professors Yasuji Himi and Yoshio Saiki for taking time out from their busy schedules to proofread the manual. I would like to extend my greatest appreciation to all those who have been involved in the making of this manual.

March, 1998

Osamu Watanabe, Managing Director
Overseas Environmental Cooperation Center, Japan
Contents

Chapter 1  An Introduction to Air Pollution ................................................................. 1
  1.1  An Outline of the "Atmosphere" ............................................................................. 1
      1.1.1  Composition of the Atmosphere ................................................................. 1
      1.1.2  Structure of the Atmosphere ......................................................................... 2
      1.1.3  Solar Radiation ............................................................................................. 3
  1.2  Definition of Air Pollution and Air Pollutants ...................................................... 5
      1.2.1  Foreword ....................................................................................................... 5
      1.2.2  The Sources and Types of Air Pollutants ...................................................... 5
      1.2.3  Air Pollutants .............................................................................................. 5
      1.2.4  Other Air Pollutants ..................................................................................... 6
      1.2.5  New Air Pollutants ...................................................................................... 7
  1.3  Air Pollution and the Issue of Resources ............................................................... 8
      1.3.1  Energy and Air Pollution .............................................................................. 8
      1.3.2  Air Pollution Control and Resource Recovery .............................................. 9
      1.3.3  Resource Development and Environmental Issues .................................... 9
      1.3.4  Securing and Treating Water for Industrial Use and Transportation Issues .................................................................................. 10
      1.3.5  Environment and Resource Issues ............................................................... 10
  1.4  Global environmental problems ............................................................................ 11
      1.4.1  Introduction .................................................................................................. 11
      1.4.2  Global warming ........................................................................................... 11
      1.4.3  Depletion of the stratospheric ozone layer .................................................. 12
      1.4.4  Acidification of the tropospheric air (acid rain) ............................................ 12

Chapter 2  History of Air pollution .............................................................................. 15
  2.1  Historical Review of Air pollution around the World ......................................... 15
      2.1.1  Introduction .................................................................................................. 15
      2.1.2  England ....................................................................................................... 16
      2.1.3  America ....................................................................................................... 17
      2.1.4  Air pollution in the Megalopolises around the world .................................. 18
  2.2  Historical Retrospective of Air Pollution in Japan ................................................ 20
      2.2.1  Air Pollution, the First Stage ....................................................................... 20
      2.2.2  Air Pollution, the Second Stage ................................................................... 23
      2.2.3  Air Pollution, the Third Stage ..................................................................... 28

Chapter 3  Background to air pollution regulations in Japan ........................................ 35
  3.1  Overview ............................................................................................................. 35
Chapter 4  Weather Conditions, and the Variation and Distribution of the Concentration of Air Pollutants  
4.1 Effect of Weather Conditions  
4.1.1 Preface  
4.1.2 Atmospheric Boundary Layer  
4.1.3 Vertical Variation of Air Temperature  
4.1.4 Vertical Distribution of Temperature and Diffusion  
4.1.5 Vertical Distribution of Wind  
4.1.6 Urban Wind and Air pollution  
4.1.7 Urban Boundary Layer and Air Pollution  
4.1.8 Synoptic Meteorology and Local Meteorology  
4.2 Formation Mechanism of Air Pollutants  
4.2.1 Introduction  
4.2.2 Photochemical Reaction of Ozone Formation  
4.2.3 Reaction of Hydrocarbons  
4.2.4 Atmospheric Chemical Reaction Associated With Acidification of Tropospheric Air (Acid Rain)  
4.3 Concentration Variation of Air Pollutants  
4.3.1 Introduction  
4.3.2 Diurnal Variation of Air Pollutant Concentration and the Mutual Relationship Among Pollutants  
4.3.3 Seasonal Variation of Air Pollutant Concentration  
4.3.4 Annual Variation of Air Pollutant Concentration and Its Statistical Analysis  
4.4 Distribution of Air Pollutants  
4.4.1 Introduction  
4.4.2 Flow of Air Pollution from City to Suburbs  
4.4.3 3D Distribution of Air Pollution  
4.4.4 Distribution of Wide Area Air Pollution  
4.4.5 Measurement of Distribution and Monitoring of Air Pollution  

Chapter 5  Effect of Air Pollutants  
5.1 Health effects on human  
5.1.1 Introduction  
5.1.2 Respiratory system
5.1.3 What respiratory diseases are induced by air pollutants? ........................................... 67
5.1.4 Health effects of typical air pollutants ........................................................................ 69

5.2 Effect on Vegetation ........................................................................................................ 72
5.2.1 Introduction .................................................................................................................. 72
5.2.2 Expressions of visible plant damage ......................................................................... 72
5.2.3 The effect on plant's physiological function and yield .............................................. 75

5.3 The effects of air pollution on materials and cultural properties ................................... 78
5.3.1 Introduction .................................................................................................................. 78
5.3.2 The effects of air pollution relating to raw materials ................................................. 78
5.3.3 Mechanisms for the effects of atmospheric pollution .............................................. 81
5.3.4 Conclusion ................................................................................................................... 81

5.4 Visibility degradation ...................................................................................................... 82
5.4.1 Introduction .................................................................................................................. 82
5.4.2 Causes of visibility degradation ................................................................................. 82
5.4.3 Measuring visibility ...................................................................................................... 84
5.4.4 Effects of visibility degradation ................................................................................... 84

5.5 Effects on senses (sense of smell) ................................................................................ 86
5.5.1 Sense of smell ............................................................................................................... 86
5.5.2 Features of the sense of smell .................................................................................... 87
5.5.3 Effects on the physiological functions of odors ......................................................... 89
5.5.4 Effects of odors and their uses .................................................................................. 90

Chapter 6 Overview of Sources of the Air Pollutants .......................................................... 95
6.1 Stationary Combustion Facilities .................................................................................... 95
6.1.1 Introduction .................................................................................................................. 95
6.1.2 Formation of Major Air Pollutants .......................................................................... 96
6.1.3 Thermal Power Station ............................................................................................... 97

6.2 Source of Dust ................................................................................................................ 101
6.2.1 Introduction .................................................................................................................. 101
6.2.2 Pulverization or Crushing Process ............................................................................ 101
6.2.3 Polishing Process ........................................................................................................ 102
6.2.4 Sieving of Particles .................................................................................................... 102
6.2.5 Transportation of Particles ....................................................................................... 102
6.2.6 Pile of Particles .......................................................................................................... 103

6.3 Chemical Process .......................................................................................................... 104
6.3.1 Introduction .................................................................................................................. 104
6.3.2 Cement Industry ......................................................................................................... 104
6.3.3 Sulfuric Acid Industry ................................................................................................. 106
7.2.2 Examples of instruction and agreements ........................................... 148
7.2.3 Gradual introduction of restrictions and results .................................... 148
7.3 Better fuel countermeasure ................................................................... 153
  7.3.1 Introduction ................................................................................... 153
  7.3.2 The necessity of better fuel countermeasure .................................... 153
  7.3.3 Fuel usage standards as a Air Pollution Control Law ....................... 153
  7.3.4 The effects of using better fuel .................................................... 153
  7.3.5 Supply of high-quality fuels ....................................................... 154
7.4 Combustion control and energy saving .................................................. 156
  7.4.1 The meaning of combustion control .............................................. 156
  7.4.2 Trends in combustion control and energy saving in Japan ............... 156
  7.4.3 Items to mention ........................................................................ 159
7.5 Process Management ........................................................................... 160
  7.5.1 Overview .................................................................................... 160
  7.5.2 Method through Cleaning of a Workplace ...................................... 160
  7.5.3 Method through Management of Raw Materials and Fuels Used during the Process .................................................. 160
  7.5.4 Strengthening of the Process Maintenance and Management .......... 161
  7.5.5 Improving Processes .................................................................. 161
  7.5.6 Rationalizing Processes Through Combination .................................. 161
7.6 Dust Collector ..................................................................................... 163
  7.6.1 Introduction ................................................................................. 163
  7.6.2 Changes in the dust collecting techniques in Japan ......................... 163
  7.6.3 Classification of dust collector .................................................... 163
  7.6.4 Development of new technology ............................................... 164
  7.6.5 Conclusion ................................................................................. 167
7.7 Flue Gas Desulfurization Equipment and By Products ......................... 168
  7.7.1 Various Processes of Desulfurization .......................................... 168
  7.7.2 Future Trends for Flue Gas Desulfurization ................................... 174
7.8 Improving combustion as a countermeasure to NOx ............................ 175
  7.8.1 Introduction ............................................................................... 175
  7.8.2 History of combustion improvement as a countermeasure against NOx in Japan .................................................. 175
  7.8.3 Low NOx combustion technology in Japan ................................... 175
  7.8.4 Indicated problems .................................................................... 178
7.9 Denitrification of Exhaust Gas .............................................................. 179
  7.9.1 Introduction ............................................................................... 179
  7.9.2 History of Flue Gas Denitrification Techniques in Japan ................ 179
  7.9.3 Recent trends in Flue Gas Denitrification Technology in Japan .......... 181
  7.9.4 Specified Issues ........................................................................ 183
7.10 Toxic Gas Treatment ......................................................................................................... 184
  7.10.1 Adsorption Method .................................................................................................. 184
  7.10.2 Absorption Method ............................................................................................... 188
7.11 Automobile Exhaust Gas Control Measures ...................................................................... 189
  7.11.1 Introduction ........................................................................................................... 189
  7.11.2 Measure for gasoline fueled vehicle exhaust gas control ........................................ 189
  7.11.3 Diesel powered vehicles exhaust gas emission control measures .......................... 191
  7.11.4 Specified Issues ...................................................................................................... 194
7.12 Hydrocarbon Species Countermeasures ............................................................................ 195
  7.12.1 Introduction ........................................................................................................... 195
  7.12.2 Hydrocarbon Species Emission Sources ................................................................. 195
  7.12.3 Countermeasures to Hydrocarbon Species in Combustion Emission Gas ............. 195
  7.12.4 Gasoline Vapor Control Measures ....................................................................... 196
  7.12.5 Hydrocarbon Species Treatment Apparatus ......................................................... 197
  7.12.6 Countermeasures of hydrocarbon included chlorine ........................................... 198
  7.12.7 ChloroFluorocarbon .............................................................................................. 198
7.13 Offensive Odor Control Measures ................................................................................ 199
  7.13.1 Planning for Controlling Offensive Odor: Deodorization Method ......................... 199
  7.13.2 Deodorizing technologies ...................................................................................... 199
7.14 Development Planning and Examples of Countermeasure ................................................ 203
  7.14.1 Overview ............................................................................................................... 203
  7.14.2 The Negishi Bay Industrial Area Development and the Yokohama Type Agreement on Pollution Control .............................................................................. 203
  7.14.3 The Yokkaichi Petroleum Complex Plan and the Air Pollution Problem .............. 204
  7.14.4 The Significance and Air Pollution Counter Measures of the Ogishima Project .......... 205
7.15 The cost of air pollution control technology .................................................................. 207
  7.15.1 Changes in plant and equipment investment capital ............................................... 207
  7.15.2 Sulfur Oxides Countermeasures ............................................................................ 207
  7.15.3 The countermeasure cost of individual investment: the example of heavy oil power plant ........................................................................................................... 209
  7.15.4 The economic influence of sulfur countermeasures .............................................. 209

Chapter 8 Measuring method of air pollutants (emission sources) .............................................. 215
  8.1 Measuring and analytical method of air pollutants in exhaust gas ............................... 215
  8.1.1 Overview ................................................................................................................ 215
  8.1.2 Particle concentration measuring method ............................................................... 216
  8.1.3 Gaseous pollutants concentration measuring methods ........................................... 218
  8.1.4 Calculation of quantities of air pollutant emissions ............................................... 219
  8.1.5 Easy measuring methods of black smoke emission using Ringleman's smoke chart .... 220
8.2 Methods for measuring and analyzing the main components of combustion exhaust gas
     (flue gas) ........................................................................................................ 221
   8.2.1 Overview .................................................................................................. 221
   8.2.2 Sampling methods of sample gas ................................................................. 221
   8.2.3 Orsat analyzer .......................................................................................... 222
   8.2.4 Methods using measuring equipment .......................................................... 222

8.3 Automatic exhaust gas air pollutant measurer ...................................................... 225
   8.3.1 Overview .................................................................................................. 225
   8.3.2 Composition of the continuous measuring system ........................................ 225
   8.3.3 Continuous sulfur oxides analyzer in flue gas .............................................. 225
   8.3.4 Continuous nitrogen oxides analyzer in flue gas ........................................... 226

8.4 Fuel testing methods .......................................................................................... 228
   8.4.1 Overview .................................................................................................. 228
   8.4.2 Analytical method of sulfur in fuel ............................................................... 228
   8.4.3 Analytical method of nitrogen in fuel ........................................................ 228
   8.4.4 Analytical method of carbon and hydrogen in fuel ...................................... 229
   8.4.5 Testing method on Calorific value of fuel ...................................................... 229

8.5 Air Pollutant Control Equipment ....................................................................... 230
   8.5.1 Overview .................................................................................................. 230
   8.5.2 Dust collector testing methods ................................................................. 230
   8.5.3 Desulfurization and denitification equipment for flue gas testing method .... 234

8.6 Exhaust Gas Measurement for Motor Vehicles ................................................... 235
   8.6.1 Introduction .............................................................................................. 235
   8.6.2 Measuring equipment overview ............................................................... 235
   8.6.3 Procedure for testing motor vehicle exhaust gas ....................................... 240
   8.6.4 Indicated problems .................................................................................... 241

Chapter 9 Air pollution measuring methods (atmosphere) ......................................... 245

9.1 Basis of air pollution measurement .................................................................... 245
   9.1.1 Introduction ............................................................................................. 245
   9.1.2 Measurement methods classification and sampling ..................................... 245
   9.1.3 Manual analysis methods ....................................................................... 247
   9.1.4 Concentration meter ............................................................................... 249
   9.1.5 Continuous analyzers .............................................................................. 249
   9.1.6 Measurement accuracy and measurement management ............................. 250
   9.1.7 Laboratory management ....................................................................... 251

9.2 Continuous analysis methods ............................................................................. 252
   9.2.1 Introduction ............................................................................................. 252
9.2.2 Continuous analyzer ................................................. 252
9.2.3 Objectives and types of ambient air measurements ............... 253
9.2.4 Construction and facilities of measuring stations .................. 253
9.2.5 State and responses to international standards ...................... 254
9.3 Planning and managing air pollution monitoring systems ............. 259
  9.3.1 Introduction .................................................................. 259
  9.3.2 Planned disposition of the monitoring system ...................... 259
  9.3.3 Measurement sites and area of measuring station ................. 261
  9.3.4 Installation conditions of measuring equipment ................... 261
  9.3.5 Maintenance and management of measuring equipment .......... 262
9.4 Dust fall measurement methods ........................................... 263
  9.4.1 Introduction .................................................................. 263
  9.4.2 Sampling method ......................................................... 263
  9.4.3 Analysis ....................................................................... 264
9.5 Measurement Techniques of Acid Deposition .......................... 266
  9.5.1 Introduction .................................................................. 266
  9.5.2 Points for Wet Deposition Measurement Techniques ............ 266
  9.5.3 Summary ...................................................................... 269
9.6 Methods of analyzing airborne particulate matter .................... 270
  9.6.1 Introduction .................................................................. 270
  9.6.2 Atomic absorption photometry ........................................ 270
  9.6.3 Radio activation analysis ................................................ 272
9.7 Measurement methods for polycyclic aromatic hydrocarbons in suspended particles ........................................................................ 274
  9.7.1 Introduction .................................................................. 274
9.8 Methods of Analyzing Toxic Airborne Compounds (Volatile Organic Compounds) ............................................. 276
  9.8.1 Introduction .................................................................. 276
  9.8.2 Methods of analyzing benzene and other volatile organic compounds (VOCs) ...................................................... 276
  9.8.3 Formaldehyde and acetaldehyde analysis methods ............... 280
9.9 Dioxin analysis methods ......................................................... 283
  9.9.1 Introduction .................................................................. 283
  9.9.2 Sampling ...................................................................... 283
  9.9.3 Analytical operations ..................................................... 284
  9.9.4 Indication of concentration ............................................... 286
9.10 Simple NO, NO₂ measuring methods ..................................... 287
  9.10.1 Introduction .................................................................. 287
  9.10.2 Sampler construction and collection method ....................... 287
  9.10.3 Sampler preparations .................................................... 288
  9.10.4 Sampler assembly .......................................................... 288
Chapter 9 Offending Senses

9.10.5 Collection of nitrogen oxides ................................................................. 288
9.10.6 Analysis methods .................................................................................... 289

9.11 Offensive odor measuring methods ........................................................... 291
9.11.1 Overview of offensive odor measuring methods ...................................... 291
9.11.2 Instrumental analysis methods ............................................................... 291
9.11.3 Sensory test methods ............................................................................ 295

9.12 Surveys into the impact on health (epidemiological survey methods) .......... 299
9.12.1 Introduction ............................................................................................ 299
9.12.2 Steps of epidemiologically evaluating air pollution ............................... 299
9.12.3 Actual process of epidemiological survey ................................................ 299

9.13 Field survey of effects on vegetation ......................................................... 302
9.13.1 Methods of indexing the appearance of visible damage (plant indicator) 302
9.13.2 Open top chamber method ..................................................................... 302
9.13.3 Phytometer ............................................................................................. 303
9.13.4 Survey method for plants growing in the field ......................................... 304

9.14.1 Visible observation ................................................................................. 306
9.14.2 Methods of measuring and analyzing deterioration .............................. 307

9.15 Meteorological observation measurements ................................................. 308
9.15.1 Introduction ............................................................................................ 308
9.15.2 Surface meteorological observation ......................................................... 308
9.15.3 Upper air meteorological observation ..................................................... 308
9.15.4 Continuous remote sensing of upper atmosphere meteorology .......... 310
9.15.5 Meteorological network ......................................................................... 310

Chapter 10 Air Pollution Estimating Techniques ............................................ 315

10.1 The Theory of Atmospheric Diffusion ....................................................... 315
10.2 Outline of the Model to Estimate Atmospheric Diffusion ......................... 320
10.2.1 Plume and Puff Models .......................................................................... 320
10.2.2 The Numerical Simulation Model ......................................................... 321
10.2.3 The particle method model of diffusion .................................................. 323
10.2.4 The model of the plume rise .................................................................. 324

10.3 Investigation of atmospheric diffusion ....................................................... 325
10.3.1 Meteorological conditions investigation ................................................. 325
10.3.2 Investigation of the diffusion condition .................................................. 327

10.4 The Practical Method of Estimation Air Pollution ....................................... 329
10.4.1 Estimating the long-term concentration .................................................. 329
10.4.2 Estimating the short-term average concentration .................................... 333
10.4.3 Estimating chemically reactive substances ........................................ 334
10.4.4 Estimating from wind tunnel tests .................................................. 335
10.5 The Statistical Forecasting Model .......................................................... 338
10.6 CMB Method ....................................................................................... 340
10.6.1 Overview ......................................................................................... 340
10.6.2 The CMB model ................................................................................ 340
10.6.3 Index elements .................................................................................. 344

Chapter 11 System of Air Quality Conservation Laws .................................... 347
11.1 Overview ............................................................................................. 347
11.1.1 Laws and Ordinances ...................................................................... 348
11.1.2 Conventions, Protocols, and Declarations ....................................... 348
11.2 The Basic Environment Law .................................................................. 349
11.2.1 Overview ........................................................................................ 349
11.2.2 Environmental Quality Standards ................................................... 349
11.2.3 Environmental Pollution Control Programs ..................................... 350
11.2.4 International Cooperation ............................................................... 350
11.3 Air Pollution Control Law ...................................................................... 351
11.3.1 Overview ......................................................................................... 351
11.3.2 Smoke and Soot ............................................................................. 354
11.3.3 Particulate dust ............................................................................... 359
11.3.4 Motor Vehicle Exhausts .................................................................. 359
11.3.5 Controls on Harmful Air Pollutants ................................................ 359
11.4 Law Concerning Special Measures to Reduce The Total Mass of Nitrogen Oxides Discharged by Motor Vehicles in Specified Areas (The Motor Vehicle NOx Law) .......................................................... 361
11.4.1 Background .................................................................................... 361
11.4.2 Overview ......................................................................................... 361
11.5 Offensive Odor Control Law .................................................................. 365
11.6 Law Concerning the Improvement of Pollution Prevention Systems in Specific Factories ................................................................. 365
11.7 Environmental Impact Assessment Law ............................................... 366
11.8 Law Concerning Rational Use of Energy (Energy Conservation Law) ................................................................. 366
11.9 Conventions, Protocols and Associated Laws ....................................... 367
11.9.1 Overview ......................................................................................... 367
11.9.2 Conventions and Protocols ............................................................... 367
11.9.3 Promulgation of Domestic Laws ....................................................... 367

Chapter 12 Administrative Outline of Air Quality Conservation ................. 369
12.1 Air Quality Conservation Administrative Framework and Enforcement System ................................................................. 369
12.2 Atmospheric Environment Monitoring System ............................................. 372
  12.2.1 Overview ................................................................................................. 372
  12.2.2 Information Flow in the Atmospheric Environment Monitoring System .......... 372
  12.2.3 Atmospheric Environment Monitoring System Applications ...................... 372
12.3 Factory Inspections ...................................................................................... 376
  12.3.1 Overview ................................................................................................. 376
  12.3.2 Items Targeted for Inspection .................................................................. 376
  12.3.3 Inspections .............................................................................................. 378
12.4 Environmental Impact Assessment System .................................................. 379
  12.4.1 The Process of Establishing the Environment Impact Assessment System ....... 379
  12.4.2 Environmental Impact Assessment Law and An Overview of the System ......... 379
  12.4.3 Assessment concerning Air Quality Conservation ....................................... 381
12.5 System of Pollution Control Manager, etc. .................................................. 385
  12.5.1 Background Circumstances ...................................................................... 385
  12.5.2 Specified Factories .................................................................................. 385
  12.5.3 Qualification Acquisition ......................................................................... 385
  12.5.4 Job Specifications ................................................................................... 385
  12.5.5 Other Systems Related to Air Quality Conservation .................................... 387
12.6 Supporting System of Pollution Control Measures ........................................ 388
  12.6.1 Governmental Supports for Commercial Pollution Control Investment .......... 388
  12.6.2 Effects of Supporting Measures ................................................................ 389
12.7 Systems of Compensation and Prevention for Pollution–Related Health Damage . 391
  12.7.1 Frequent Incidents of Health Damage Followed by the Yokkaichi Pollution Lawsuit, and the Establishment of the System for Pollution-related Health Damage compensation ............................................................................. 391
  12.7.2 Recognition of the victims and Compensation, and the Expense Bearing .................. 391
  12.7.3 System Reform Accompanying improved State of Pollution ....................... 392
  12.7.4 From Individual Patient Compensations to Health Damage Prevention Programs Directed At Entire Areas .......................................................................................................................... 393
