JAXA satellite programs

Date 12:54, January 2

Greenhouse gases observing satellite (GOSAT)

- Monitoring global distribution of Greenhouse Gases from space.
- Observe Carbon dioxide and Methane at 100-1000km spatial scale with relative accuracy of **1% (4ppm) for CO₂** and **2% (34ppb) for CH₄**.
- Joint project by JAXA, NIES (National Institute for Environmental Studies), and MOE (Ministry of the Environment) .
- Launch: 23 January 2009 by H2A launch vehicle
- Mission lifetime: 5 years to 2014

**GOSAT satellite at
Tanegashima Space Center**

GOSAT satellite and sensors

Size	Main body	3.7 m x 1.8 m x 2.0 m (Wing Span 13.7m)
Mass	Total	1750kg
Power	Total	3.8 KW (EOL)
Life Time		5 years
Orbit		sun synchronous orbit
	Local time	13:00+/-0:15
	Altitude	666km
	Inclination	98deg
	Repeat	3 days
Launch	Vehicle	H-IIA
	Schedule	Jan. 23 2009

TANSO=Thermal And Near infrared Sensor for carbon Observation

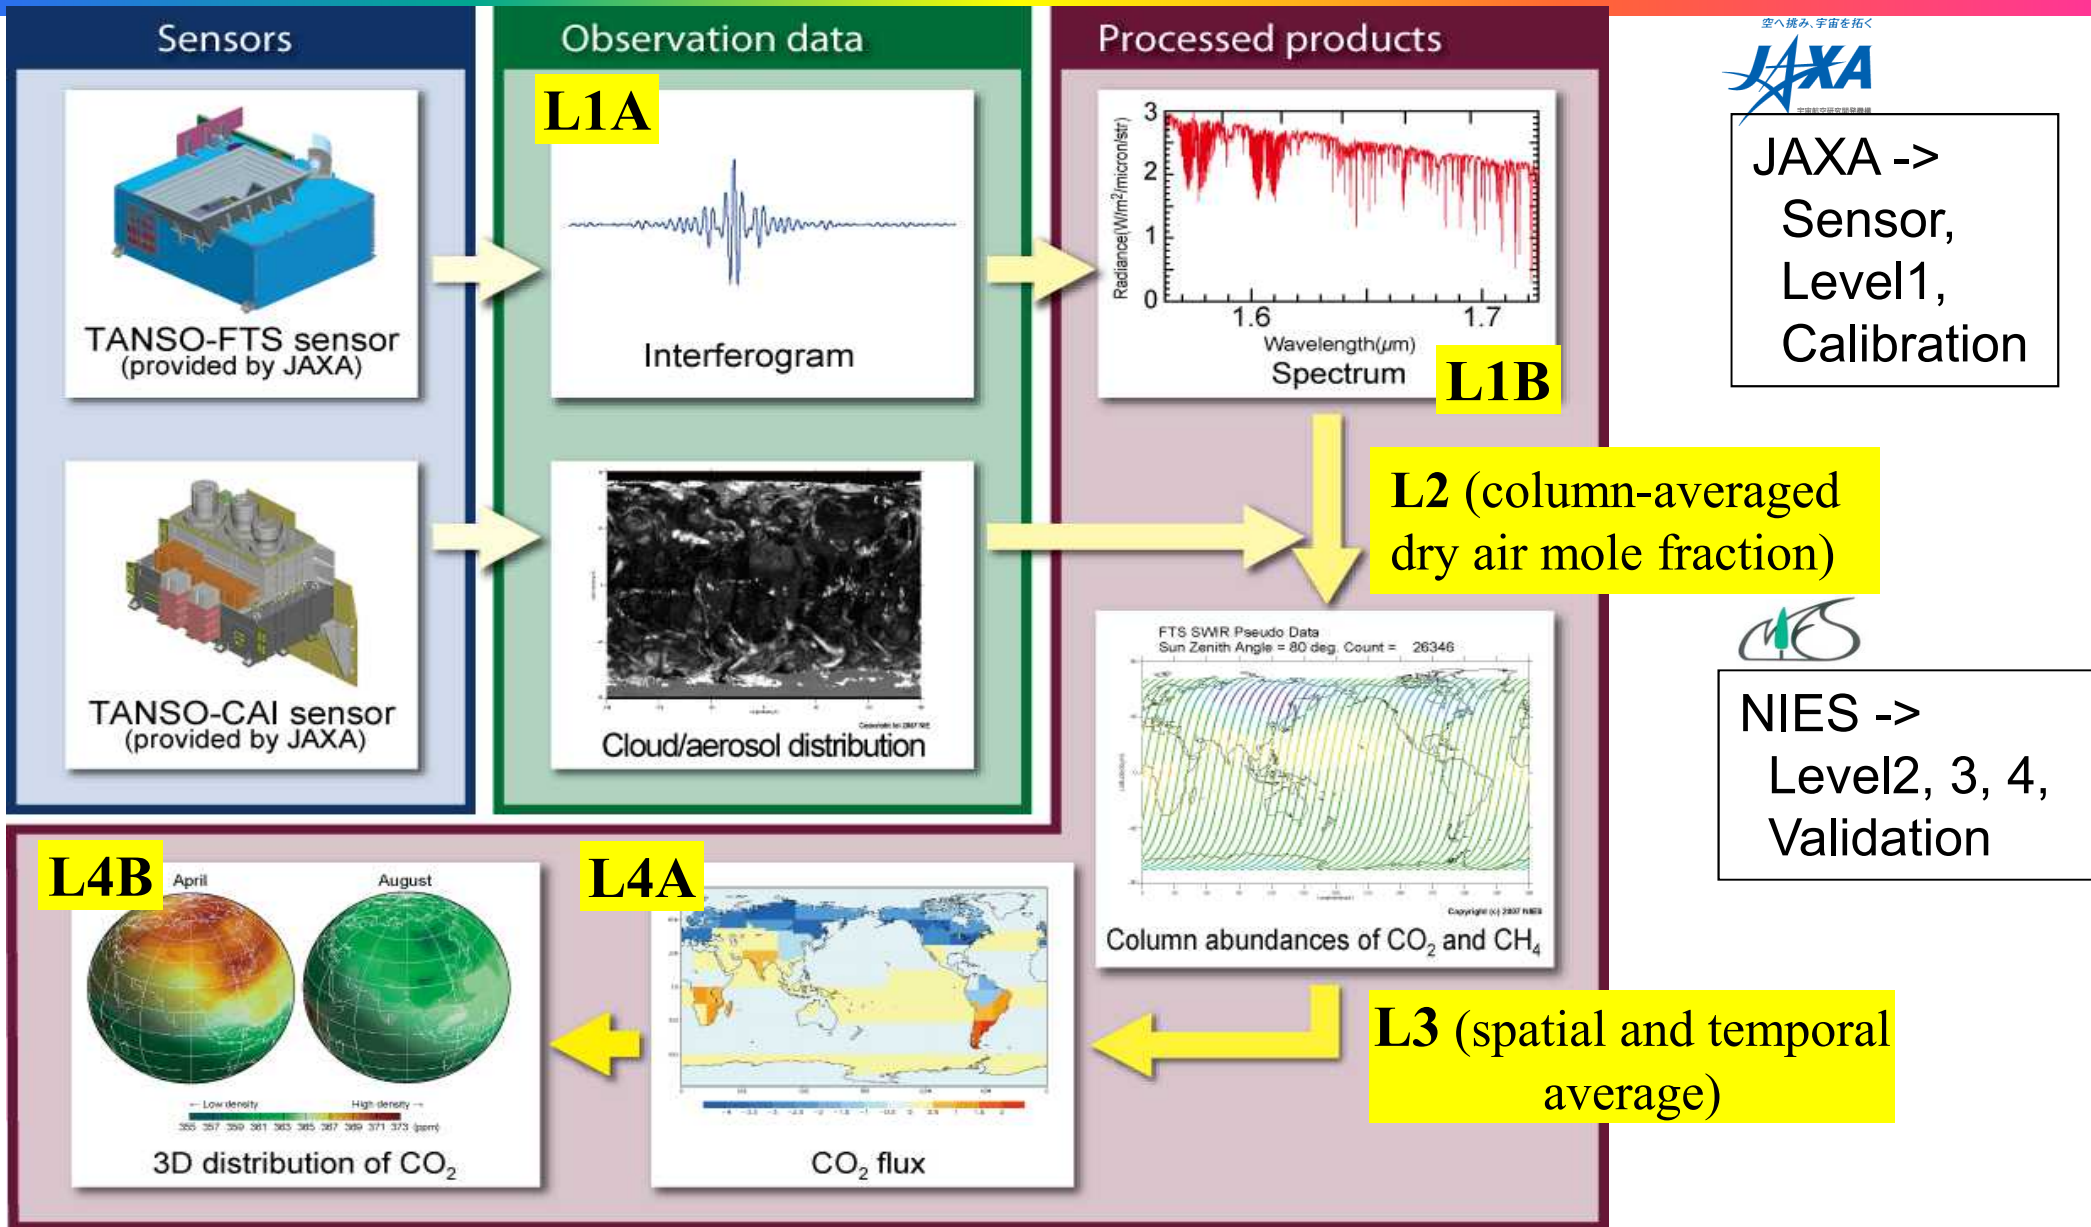

TANSO-FTS
(Fourier Transform Spectrometer)

TANSO-CAI
(Cloud and Aerosol Imager)

GOSAT Data Processing

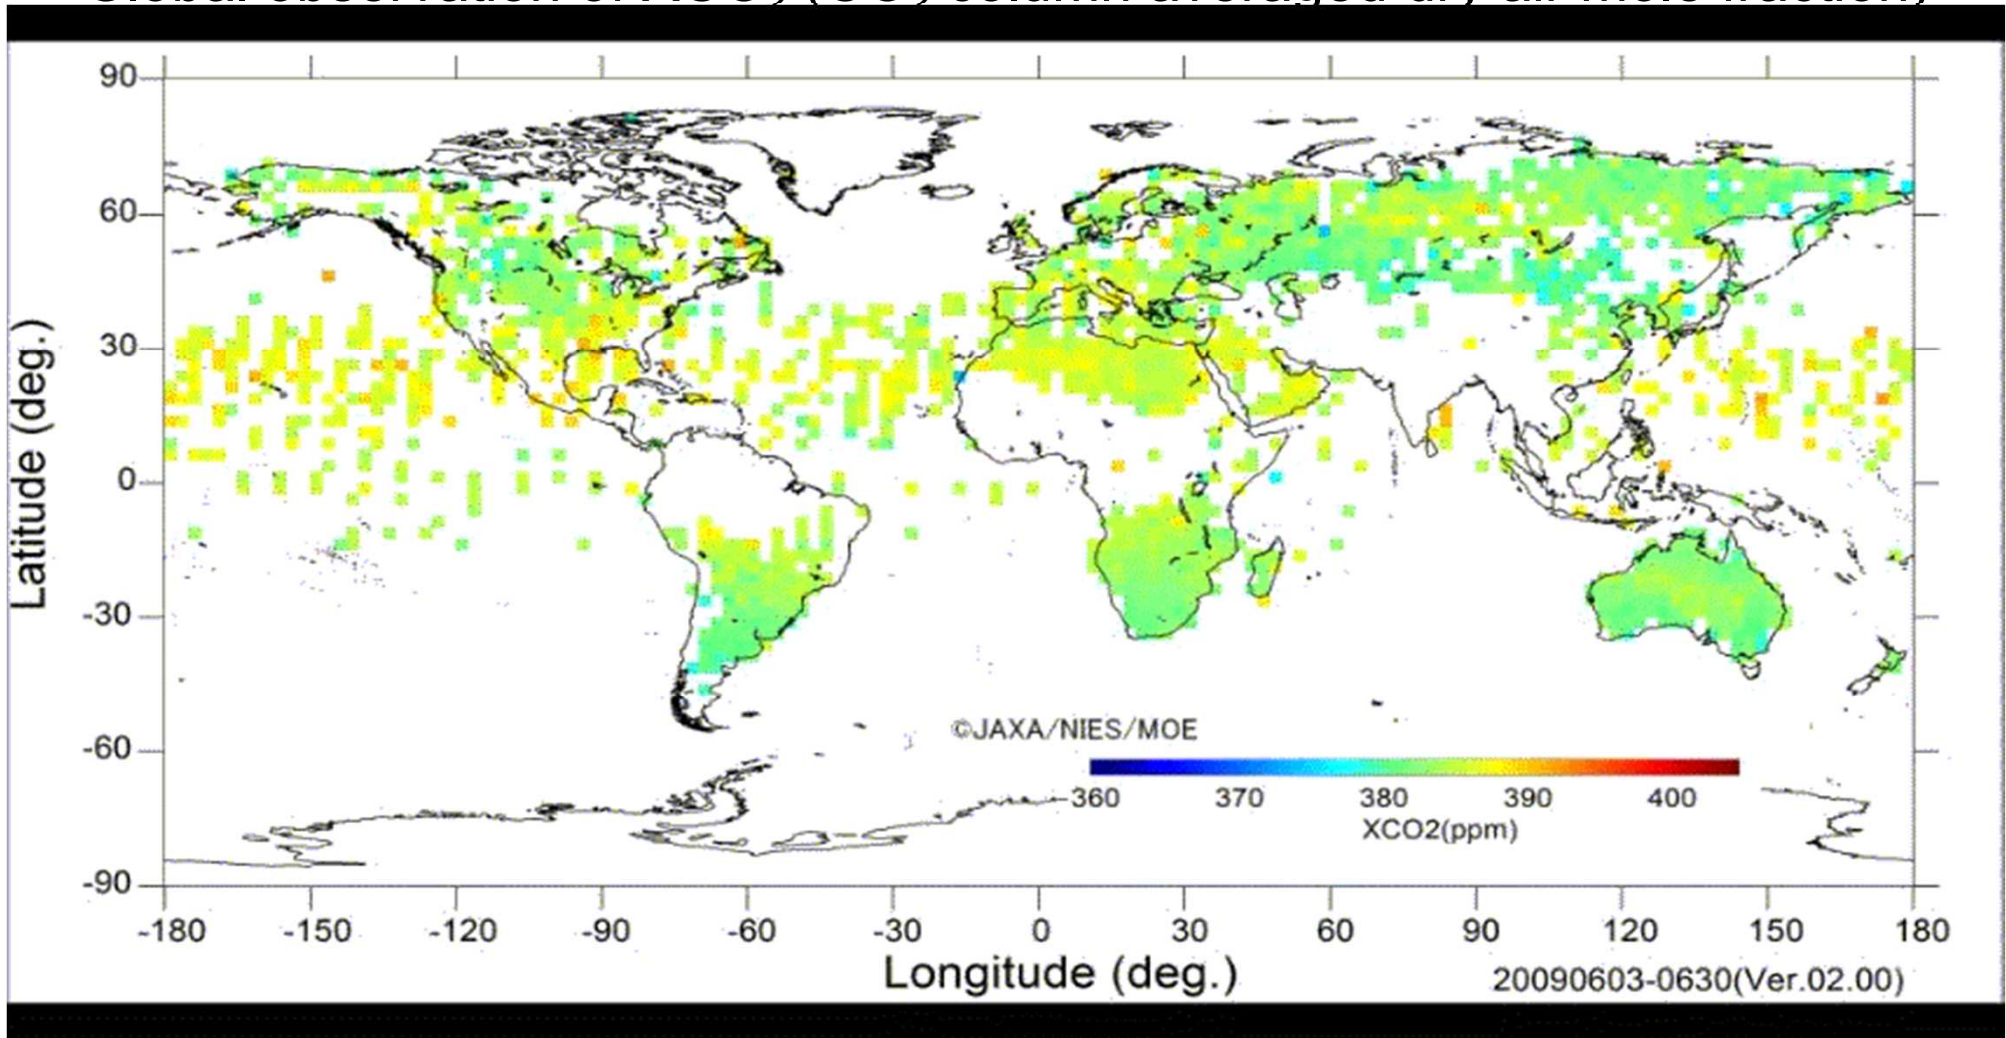

Monthly averaged CO₂ observation from space

Global observation of XCO₂ (CO₂ column averaged dry air mole fraction)

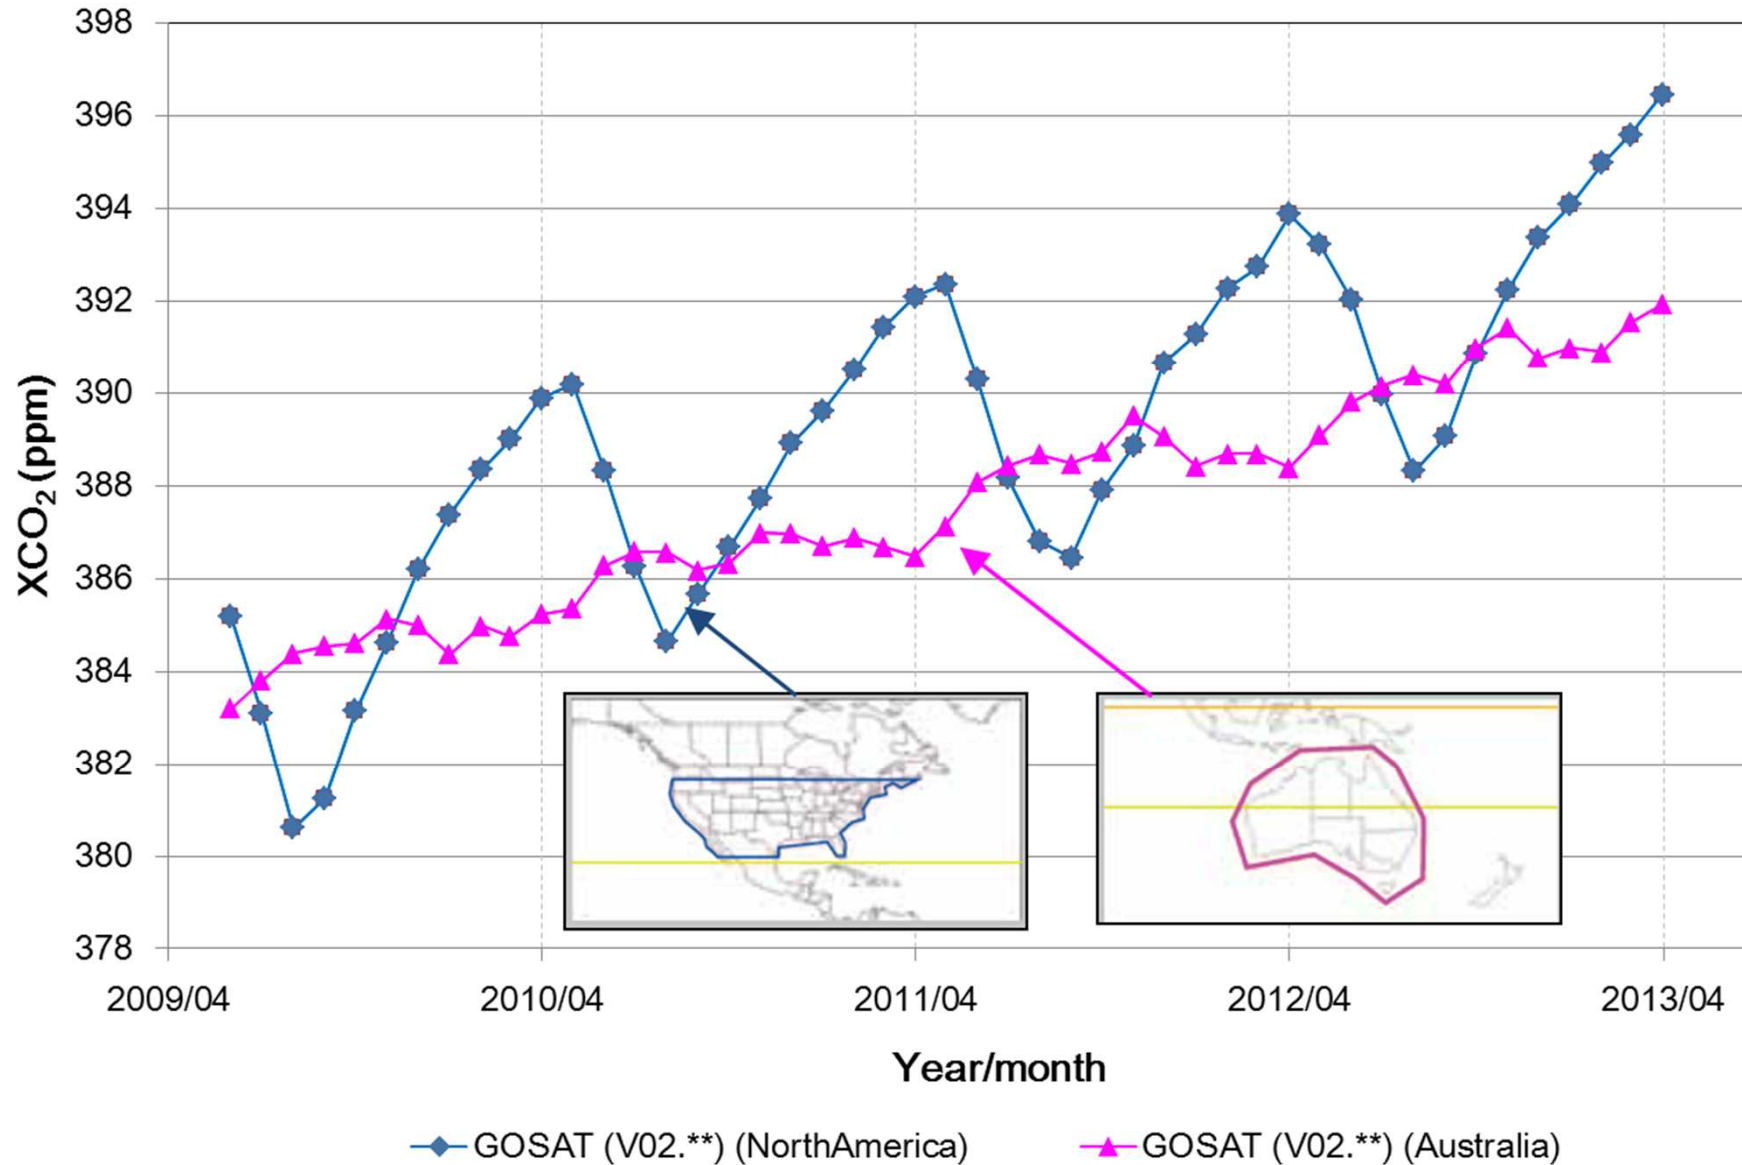

XCO₂ is validated with an uncertainty of -1.2 ± 2.0 ppm (-0.3 ± 0.5 %).

GOSAT achieves the CO₂ observation precision of 0.5% (2ppm) much higher than the mission goal of 1% (4ppm).

from GOSAT User Interface Gateway (GUIG) 6

Monthly regional averages of XCO₂

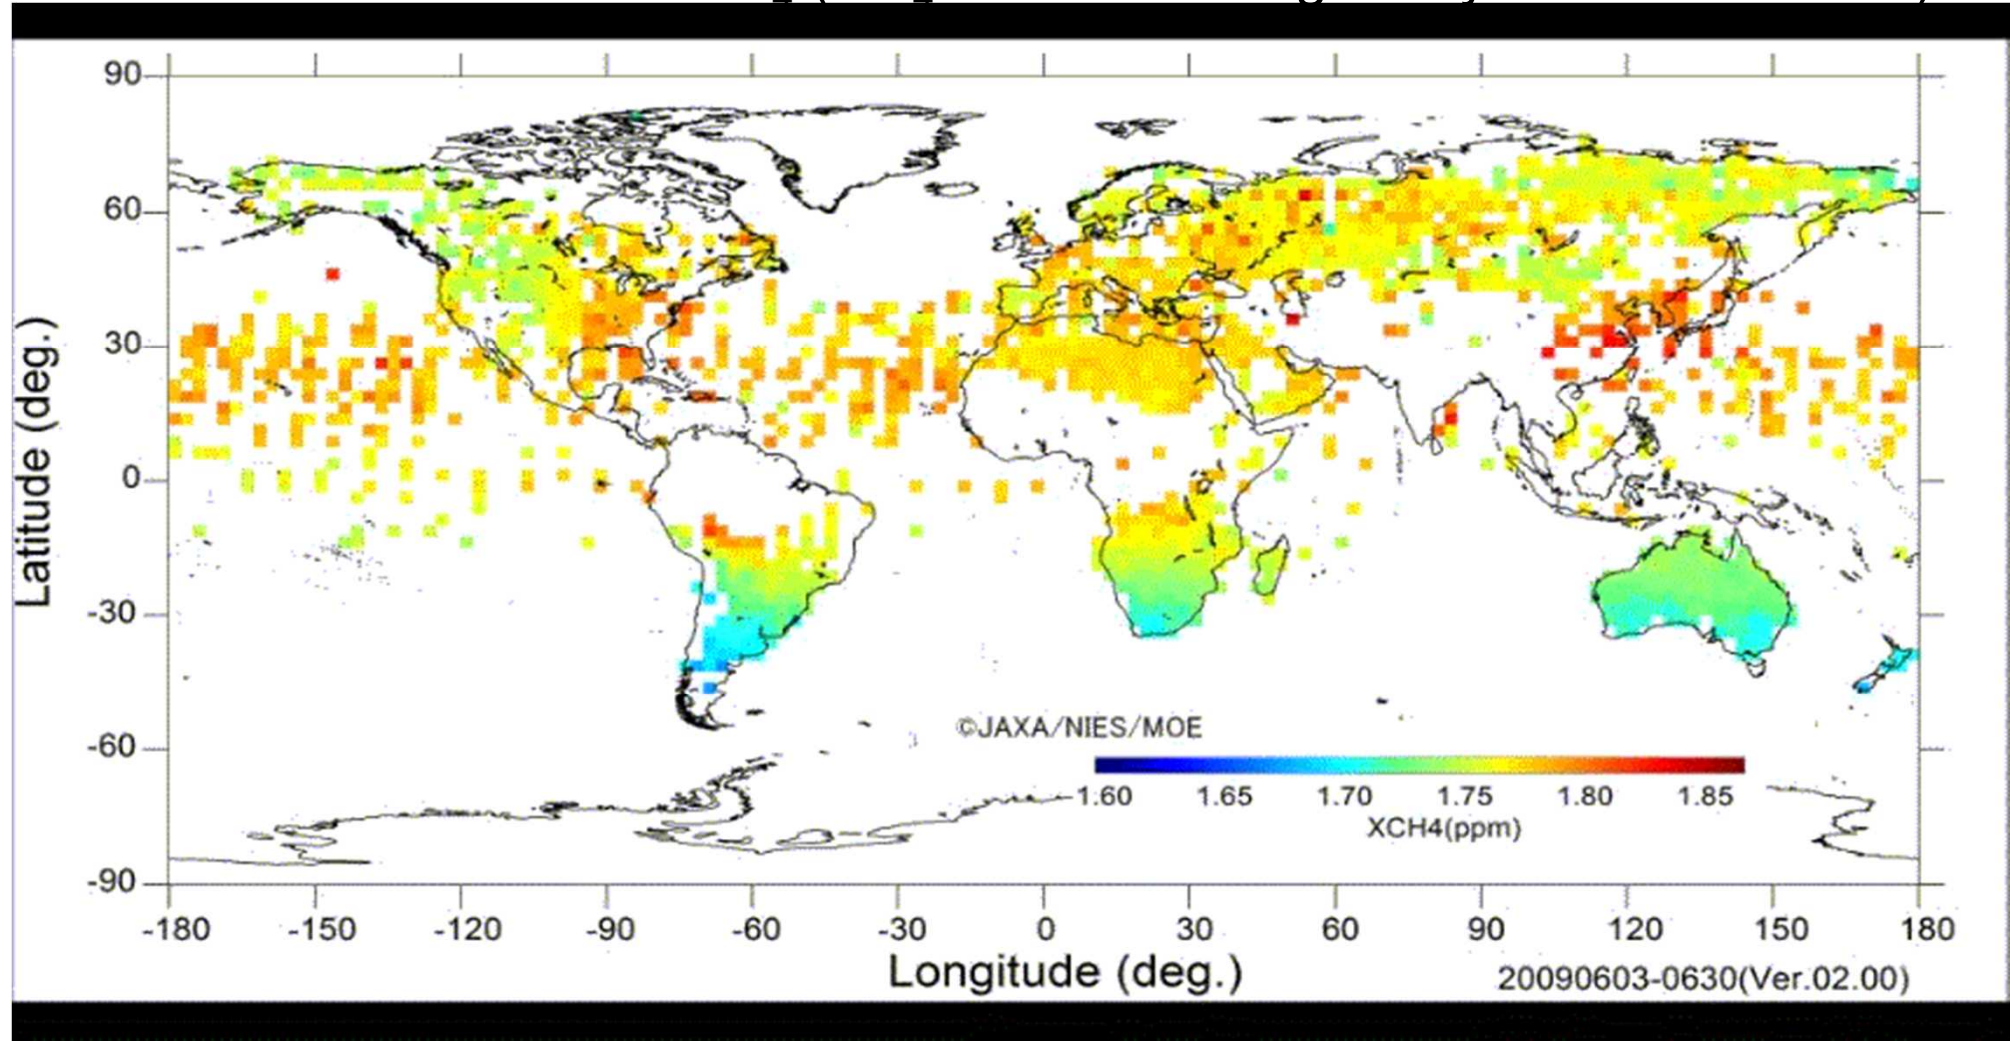

Monthly averaged CH₄ observation from space

Global observation of XCH₄ (CH₄ column averaged dry air mole fraction)

XCH₄ is validated with an uncertainty of -7 +/- 12 ppb (-0.4 +/- 0.7 %).

GOSAT achieves the CH₄ observation precision of 0.7% (12ppb) much higher than the mission goal of 2% (34ppb).

GOSAT referred in IPCC AR5

Atmospheric change of CH_4 is monitored in vertical averaged concentration by remote sensing from ground-based instruments and space-borne satellites.

- Ground-based FTIR (Total Carbon Column Observing Network, TCCON; <http://www.tccon.caltech.edu/>)
- AIRS (since 2002; <http://airs.jpl.nasa.gov>)
- TES (since 2004; <http://tes.jpl.nasa.gov>)
- IASI (since 2006; Crévoisier et al., 2009)
- SCIAMACHY (2003–2012; Frankenberg et al., 2008)
- **GOSAT-TANSO-FTS (since 2009; Morino et al., 2011)**
- *In-situ* measurement is precisely ($\sim 0.2\%$) at limited surface locations.
- Satellite measurement is lower precision ($\sim 2\%$, currently $\sim 0.7\%$) with global coverage.

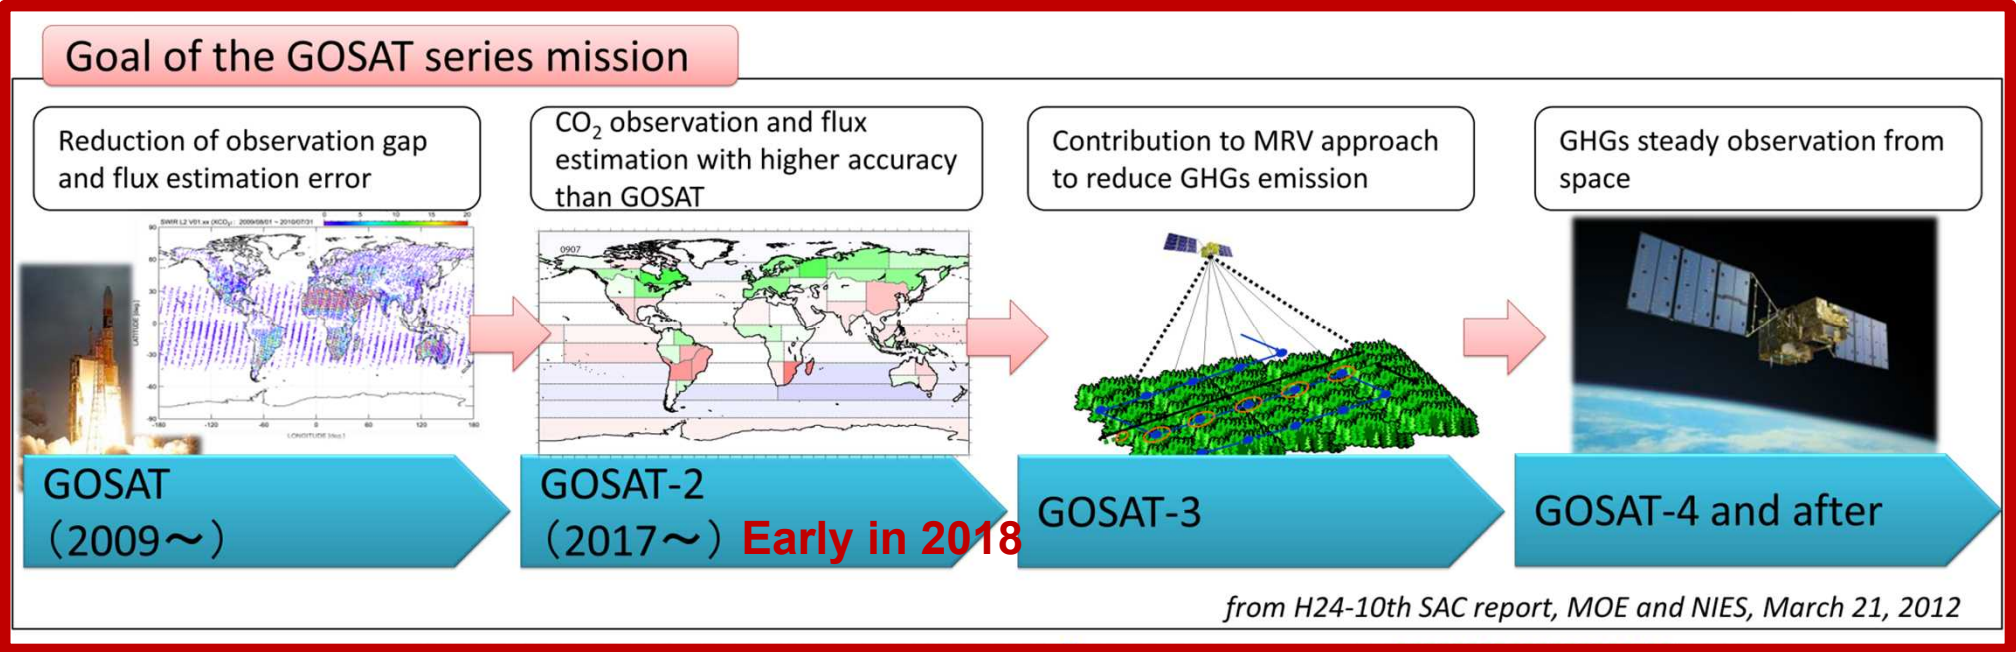

Atmospheric change of CO_2 from satellite measurements is not referred in AR5.

GOSAT-2 - the next GHGs mission

Timeline of Total Column CO2 Observing Satellites

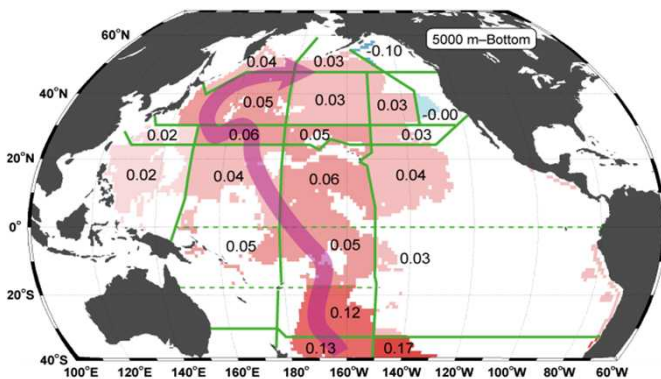

from Matsunaga's presentation, GOSAT workshop 2013, March 2013.

Scientific Results from Ocean Climate Change Research Program of JAMSTEC

◆ Bottom Water Warming

- **High quality hydrographic observations were conducted** mainly in the Pacific Ocean.
- **Bottom water warming has been found in the almost entire region in the Pacific Ocean.**
- According to analyses using the Earth Simulator, **the warming trend is significant** and the possible process is that **change in air-sea interaction in the Southern Ocean could propagate into the north Pacific quickly.**

Horizontal distribution of heat content change rate in the layer between 5000m and the bottom of the Pacific (W/m^2). Red indicates heat content increase. Purple arrow indicates a pathway of deep water formed in the Southern Oceans.

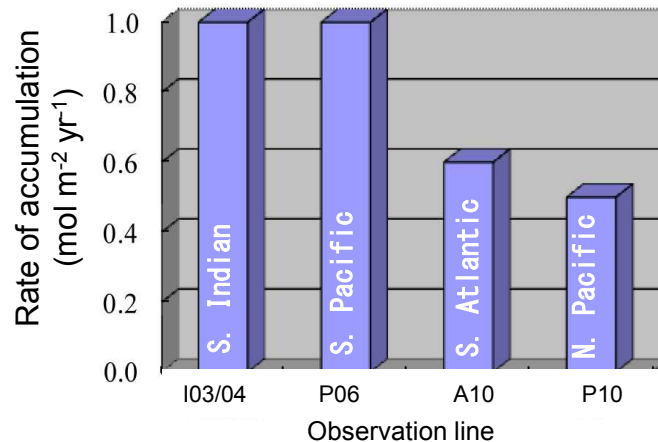

◆ CO₂ uptake by the ocean

Murata et al. (2007; 2009; 2010)

- **Calculation of rates of ¹anthropogenic CO₂ accumulation in the North and South Pacific, South Atlantic, and South India by ²Repeat Hydrography observations.**

¹CO₂ emitted into the atmosphere as a result of human activities such as burning of fossil fuels, deforestation, and cement production.

²Program of ship-based trans-oceanic observation conducted over a decade for the purpose of collecting high-accurate data

Repeat hydrography lines occupied by JAMSTEC

◆ Global water circulation enhancement

- Long term global surface salinity trend was detected comparing **Argo data for 2003-2007 with historical data in 1960-1989.**
- **High (low) salinity areas clearly became more saline (freshening) in the subtropical (subpolar /tropical) regions.**
- The intensification of surface salinity contrast suggests more excess evaporation (precipitation), indicating **an enhancement of global water cycle in association with the global warming.**

³Argo is an international project that is conducted under the World Meteorological Organization (WMO), the Intergovernmental Oceanographic Commission of UNESCO (IOC) and other related institutions. The aim of the project is to build a real time, high resolution monitoring system for upper and middle layers of the world ocean.

Surface salinity difference between 2003–07 and 1960–89 (psu)

Antarctic Research Expedition

Collaboration between CEREGE (CNRS, Aix-Marseille Univ.) and the Universities of Oxford and Tokyo and NIPR, **clarified the timing and volume of the rapid ice sheet collapse associated with the abrupt climatic events during the last glacial-interglacial transition.** This result is expected to make a significant contribution to understand the mechanism of climate change in comparison with the paleoclimate records obtained from the ice cores in Greenland and Antarctica.

Calving of the Mertz Glacier Tongue (MGT) in February 2010 reduced sea ice production, dense water formation, AABW production from this region, and **enhanced carbon uptake.** Our study suggests that changes in the Antarctic icescape can also have substantial consequences for dense water formation, carbon uptake, and biological productivity of Antarctic shelf waters.

MODIS satellite images of the Mertz Polynya and surrounds. The areas of fast ice (FI) and pack ice (PI) and the location of iceberg B9B are indicated (a) before and (b) after MGT calving.

(a) Upper ocean salinity profiles and (b) nDIC profiles in the Mertz Polynya in winter 1999 (green), summer 2001 (black), summer 2008 (blue), and summer 2011 (red).

JAXA Global Rainfall Watch

【世界の雨分布速報】は、熱帯雨帯観測衛星 (TRMM) など衛星観測を利用して世界の降雨分布を、0.1 度の格子の分解精度で、観測から約 4 時間遅れの準リアルタイムで 1 時間毎に作成・可視化して公開するものです。複数のマイクロ波観測射影を中心に、静止衛星赤外線射影の情報も利用するシステム構築により、観測精度の高い降雨分布の提供が可能となりました。

A system of "JAXA Global Rainfall Watch" offers hourly global rainfall mass in 0.1 degree grid resolution within four hours after observation from the Tropical Rainfall Measuring Mission (TRMM). From multiple microwave radiometer (MWR) data and geostationary IR data, the system has been operated with a blended MWR-IR algorithm and it enables us high frequent rainfall datasets.

THE ESA-JAXA JOINT MISSION
EarthCARE
Earth Cloud, Aerosol and Radiation Explorer

cesea NICT JAXA

To Reveal the Impact of Clouds and Aerosols to Climate Change

Warming? or Cooling?

EarthCARE Satellite
Sun-Synchronous Orbit (SSO)
Orbit height: approx. 370km
Orbit inclination: 97 deg.
Resonant Period: 21 days

Cloud Profiling Radar (CPR)
Atmospheric Lidar (ATLID)
Broadband Radiometer (BBR)
3-Dimensional Cloud, Aerosol, Radiative Flux (3-CARFAX)
Multi-Spectral Imager (MSI)

Clouds effect both heating and cooling to the atmosphere depending on their height and optical thickness. Upper clouds, such as Cirrus, have heating effect, whereas lower clouds, such as Stratocumulus, have cooling effect. Furthermore, aerosols have direct effects on atmosphere in terms of heating/cooling. They also have indirect effects that change cloud microphysics (i.e. the size, particle radius). Differences in the vertical distributions of cloud/aerosols and interactions between clouds and aerosols in the models cause large errors in climate predictions.

Human impacts on Global Warming
CO₂, CH₄, N₂O, Halocarbons are heating factors, having small uncertainties.
Net Clouds, Aerosols are cooling factors, having large uncertainties.

Science Challenging
