Progress on Off-site Cleanup Efforts in Japan

April, 2014

Ministry of the Environment, Japan
• Policy Framework
• Progress in Special Decontamination Area
• Progress in Intensive Contamination Survey Area
• Decontamination technology
• New policies announced in Sep 2013
• Efforts to secure Interim Storage Facility
Radioactive Pollution Caused by the Accident at TEPCO’s Fukushima Dai-ichi NPS
Framework of Decontamination

Legislation for Promoting Decontamination

◆ The Act on Special Measures Concerning the Handling of Radioactive Pollution came into force on January 1, 2012.
◆ Based on this Act the followings are carried out:
  - Planning and implementation of decontamination work
  - Collection, transfer, temporary storage, and final disposal

Special Decontamination Area

◆ 11 municipalities in (former) restricted zone or planned evacuation zone (<20km from the NPS, or annual cumulative dose is >20mSv)
◆ Decontamination is implemented by the national government

  (*) Entire area of Naraha, Tomioka, Okuma, Futaba, Namie, Katsurao, and Iitate. Some area of Tamura, Minami Soma, Kawamata, and Kawauchi.

Intensive Contamination Survey Area

◆ 100 municipalities in 8 prefectures (*), in which over 0.23 μSv/hour of air dose rate (regarded as being over 1 mSv/Year under a certain condition) is observed, were designated.
◆ Decontamination is implemented by each municipality. The national government will take financial and technical measures.

  (*) Iwate, Miyagi, Fukushima, Ibaraki, Tochigi, Gunma, Saitama, and Chiba

• Policy Framework
• **Progress in Special Decontamination Area**
• Progress in Intensive Contamination Survey Area
• Decontamination technology
• New policies announced in Sep 2013
• Efforts to secure Interim Storage Facility
Current Status of the Areas to Which Evacuation Order have been Issued (as of End of Aug, 2013)

Ahead of the decontamination in the Special Decontamination Area, Decontamination Plans are to be elaborated taking into account the progress of rearrangement of the Restricted Areas and Deliberate Evacuation Area. The rearrangement has been completed on Aug 7 2013.

3 categories after the rearrangement:

Area 1: <20 mSv/yr
Evacuation orders are ready to be lifted:

Area 2: 20 – 50 mSv/yr
Residents are not permitted to live:

Area 3: >50 mSv/yr
Residents will have difficulties in returning for a long time:
Decontamination Policy for Special Decontamination Area

Policy in FY2012 and 2013

Decontamination should be implemented taking into account the level of air dose rate.

- **Area less than 20mSv/year**: Aiming to reduce additional exposure dose to less than 1mSv/year as long-term goal.

- **Area from 20〜50mSv/year**: Aiming to reduce exposure dose in residential and farmland area to less than 20mSv/year.
  
  > Decontamination work in all municipalities in the Area has been uniformly scheduled to be completed within 2 years, assuming the securing of temporary storage sites and consent of landowners, etc.

  > In the case of areas more than 50mSv/year, demonstration projects are in progress. Lessons learned will be taken into consideration in future decontamination policy.

Policy Review at Sep. 2013

- Decontamination work will be implemented in cooperation with reconstruction measures depending on the situation of each municipality. Additional measures for further progress will be conducted.

- The decontamination plans in six municipalities were revised and new schedules were set up in December, 2013
Progress in the Special Decontamination Area

Decontamination Plan has been established in 10 municipalities out of 11 target municipalities and the progress has been made. Decontamination works in Tamura, Naraha, Kawauchi and Okuma have been completed at the end of March, 2014.

Note 3: ①, ②, ③ might be modified with further review
Note 4: “—” indicates that decontamination work has been signed for decontamination and in process of partial operation
New schedule to be targeted for Special Decontamination Area

- Among 11 municipalities, the decontamination work for Tamura has been completed. For Naraha, Kawauchi, and Okuma, the decontamination work has been completed by the end of March, 2014 as scheduled in the original plan.
- For Minami-Soma, Iitate, Kawamata, Katsurao, Namie, and Tomioka, the decontamination plans were revised in Dec. ‘13 and a realistic schedule that meets the condition of each area were set up in consultation with each municipality and community.
- Decontamination of residential areas and their surroundings will be prioritized for the evacuees to return home.
- The decontamination projects should be implemented in an accelerated and smooth manner and the project terms should be shortened as much as possible. The work process should be fully controlled and the progress status should be made open to public.

<table>
<thead>
<tr>
<th>Minami-Soma</th>
<th>The residential areas and their surroundings will be decontaminated on a priority basis by the end of March, 2016.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The rest will be decontaminated by the end of March, 2017. The decontamination will be made in an accelerated and smooth manner and the work term will be shortened as much as possible.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Iitate</th>
<th>The residential areas and their surroundings will be decontaminated on a priority basis by the end of March, 2015. The decontamination will be made in an accelerated and smooth manner and the work term will be shortened as much as possible to be completed by the end of 2014.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The rest will be decontaminated by the end of March, 2017. The decontamination will be made in an accelerated and smooth manner and the work term will be shortened as much as possible to be completed by the end of 2016.</td>
</tr>
</tbody>
</table>

Note: Decontamination work in a municipality is to be implemented based on the premises of formulation of the decontamination plan, securing of temporary storage sites, consent of land owners, and the ensuring of workers.
## New schedule to be targeted for Special Decontamination Area ②

<table>
<thead>
<tr>
<th>Municipal Area</th>
<th>Details</th>
</tr>
</thead>
</table>
| **Kawamata**   | - The residential areas and their surroundings will be decontaminated on a priority basis by the end of March, 2015. The decontamination will be made in an accelerated and smooth manner and the work term will be shortened as much as possible to be completed by the end of summer in 2014.  
- The rest will be decontaminated by the end of March 2016. The decontamination will be made in an accelerated and smooth manner and the work term will be shortened as much as possible to be completed by the end of 2015. |
| **Katsurao**   | - The residential areas and their surroundings will be decontaminated on a priority basis by the end of March, 2015. The decontamination will be made in an accelerated and smooth manner and the work term will be shortened as much as possible to be completed by the end of summer in 2014.  
- The rest will be decontaminated by the end of March, 2016. The decontamination will be made in an accelerated and smooth manner and the work term will be shortened as much as possible to be completed by the end of 2015. |
| **Namie**      | - Areas to be decontaminated, other than the tsunami-devastated areas (Minami-Tanashio, Ukedo-Kita, Ukedo-Minami, Nakahama, Morotake), will be decontaminated on a priority basis by the end of March, 2016.  
- For the tsunami-devastated areas, the residential areas and their surroundings will be decontaminated on a priority basis by the end of March, 2016 by paying attention to the treatment of disaster waste. The rest will be decontaminated by the end of March, 2017. The decontamination will be made in an accelerated and smooth manner and the work term will be shortened as much as possible. |
| **Tomioka**    | - The residential areas and their surroundings will be decontaminated on a priority basis by the end of March, 2016.  
- The rest will be decontaminated by the end of March, 2017. The decontamination will be made in an accelerated and smooth manner and the work term will be shortened as much as possible. |
| **Futaba**     | - Decontamination will be discussed to establish a decontamination plan by taking account of the results of the model projects, the reconstruction plan, and the dose level. |

---

Note: Decontamination work in a municipality is to be implemented based on the premises of formulation of the decontamination plan, securing of temporary storage sites, consent of land owners, and the ensuring of workers.
Overview of the Decontamination Project in Tamura City

Decontamination work based on the Decontamination Implementation Plan has been finished in Tamura City.

- **Work Period**: July 5, 2012 ~ June 28, 2013
- **Number of Workers**: Max. 1,300/day (A total of 120,000 man day)
- **Decontamination target area**: residential area and a part of forests (area within 20m from the edge) in Furumichi, Miyakoji district
- **Volumes of work**
  - Buildings: 228,249㎡ (121 family unit)
  - Roads: 95.6km
  - Farmland: 1,274,021㎡
  - Forests: 1,921,546㎡
Effect of Radiation Dose Reduction by Decontamination Work in Tamura City

(Average of Air Dose Rate at the height of 1m above ground)
Before & After the Decontamination Work
Decontamination Activities

- Wiping off rooftop and walls
- Wiping off a gutter
- High pressure water cleaning of a drain pipe
- High pressure water cleaning of paved road
- Mowing and removal of sludge
- Removal of crushed stones and topsoil, and cover with clean soil
Average Figures after the Decontamination: 0.40μSv/h

Average Figures before the Decontamination: 0.63μSv/h

Effect on Decontamination Work (a case of Tamura)

Air Dose Rate 1m above surface

Number of Measurement Points

Before the decontamination
After the decontamination
Result of post Monitoring*

*conducted between Sep. – Oct., 2013

46% of decrease
37% of decrease

Average Figures: 0.34μSv/h
Decontamination work decreased radiation dose:
e.g. approx. 36% in residential area

It is confirmed that the effect on decontamination work in whole area has been maintained, and post monitoring survey shows that radiation dose has been continuously decreasing.
The result of Post Decontamination Monitoring

- Decontamination effect in the decontamination model project area is almost maintained
- Air dose rate is decreased approx. 40% after a year and 9 months of the work

Comparison of average figure on air dose rate (assuming the figure after the work as 100)

*Measurement result just after the decontamination work in Tsushima, Namie and Iitate, might be possibly low because of accumulated snow

Note 1: Measurement figure might be changed by environmental condition, e.g. climate condition, such as rainfall, snowfall,

Note 2: It's have passed about one year and nine months from measurement result just after the decontamination work until 5th follow-up survey, during that time, the dose rate resulting from radiocaesium, about 30% of reduction is expected by physical attenuation.
Overview of Temporary Storage Site

- Removal soil and etc. has been collected and stored in temporary storage sites.
- Air dose rate at the entrance of the sites shows no difference after removed soil, etc. are stored.
- Radioactive materials has never been detected from leachate or groundwater under the sites.

<table>

</table>
Decontamination work on Joban expressway was implemented between Dec. 2012 ~ Jun. 2013. Target section = approx. 3.3km: over 3.8µSv/h ~ less than 9.5µSv/h (in a part of Hirono ~ Joban-Tomioka, 16.4km).

As the result of running survey by monitoring car, air dose rate has been much more decreased than the target value described in the "Decontamination Policy".*

**Target Value**
Less than approx. 3.8µSv/h by the reopening

**Actual Value**
1.5~1.7µSv/h average (as of Jan. 23, 2014)

*Decontamination policy includes the decrease of radiation dose which will be expected by the roadwork such as road pavement etc.

### Main Method of Decontamination

- **Slope**: Weeding
- **Road surface & ditches**: High pressure water spray

![Weeding of slope](image1)
![High pressure water spray on the road surface](image2)
• Policy Framework
• Progress in Special Decontamination Area
• **Progress in Intensive Contamination Survey Area**
• Decontamination technology
• New policies announced in Sep 2013
• Efforts to secure Interim Storage Facility
As of Mar. 2014

- Decontamination work as planned in public facilities including living environment of children is coming to an end with more than 80%
- Also the decontamination work in residential areas, farmland/meadows and roads, more than 60% have been ordered
- Steady progress has been made and there are municipalities who have already completed the planned work

- Number of municipalities designated as Intensive Contamination Survey Area:
  104 (at first) → 100 (at present)
  If the conditions would not be fulfilled, the designation of Intensive Contamination Survey Area can be lifted
  The designation was lifted in 4 municipalities up to now because of radiation dose decrease, etc.

- Decontamination implementation plans formulated (for all municipalities which have the intention):
  94 municipalities

- Publicly announced the completion of decontamination work based on the plan (monitoring survey will be continued):
  7 municipalities

- In process of implementing decontamination work based on the plan:
  87 municipalities
  Completion of the plan is set between FY2015~FY2016 (34 municipalities) in Fukushima prefecture and most of other municipalities, between FY2012~FY2013 (45 municipalities)

- According to the plans, most municipalities in Fukushima are setting their ending periods at the end of FY2015 and FY2016, while many municipalities in other prefectures are setting them at the end of FY2012 and FY2013
Decontamination implementation plans were formulated in 94 municipalities, and progress has been made (As of March, 2014)

Check up the status of municipalities tackling leading decontamination and completing decontamination work based on on-going decontamination plan. Effective information shall be shared widely among municipalities in consideration of municipalities’ status.

- The municipalities, implementing leading decontamination work, have been accumulating various original and innovative measures and know-hows, from the viewpoint of the promotion of effective and efficient decontamination work and mutual understanding between local residents.

Example: Excerpted from “Good Practice Collection” (compiled by Fukushima Office for Environmental Restoration, MOE)

- Volume reduction of the waste (twigs, etc.) discharged from decontamination work (in Date city)
- Cooperation with local residents, delivery of Q&A materials for smooth operation for explanatory meetings (in Fukushima city)

- There are municipalities of which decontamination work have completed according to the plan as of Jun., 2013

With accelerating and streamlining of decontamination work in consideration of each municipality’s status, information shall be shared by updating Good Practice Collection and by guidelines, and also exchanging opinions among municipalities.
Dissemination of Information regarding Decontamination Progress on the Website

In case of Fukushima City:

Information Site on Decontamination
URL: http://josen.env.go.jp/en/
• Policy Framework
• Progress in Special Decontamination Area

Formulation of the Decontamination Guidelines

- Technical guidelines for carrying out decontamination
- Developed to complement the Ordinance of the Ministry of the Environment
- Used as reference when ordering decontamination projects and the like

Contents
1. Guidelines on the methods of investigating and measuring the status of environmental pollution in intensive survey areas
2. Guidelines pertaining to measures on decontamination and the like
3. Guidelines pertaining to the collection and transportation of the removed soil
4. Guidelines pertaining to the storage of the removed soil

URL:
Techniques used for decontamination ①

- Houses, buildings
  - Removal of deposits from the roof, deck, and gutters
  - Wiping off the roofs and walls, high-pressure washing etc.

- Gardens and standing trees
  - Mowing, removal of fallen leaves, topsoil stripping etc.

- Roads
  - Removal of deposits in the ditch, high-pressure washing etc.

Decontaminating roofing tiles (by wiping-off)

Decontaminating paved surfaces (by a collective type high-pressure water cleaner)

Decontaminating gardens (by removing soils etc.)

Photos provided by: Date City
Techniques used for decontamination ②

- **Schoolyards, gardens and parks**
  - Stripping of soils and topsoils etc.

- **Farmlands**
  - Reversal tillage, soil disturbance using water, stripping of topsoils etc.

- **Forests and woods**
  - Removal of fallen leaves and lower twigs, pruning etc.

Decontaminating a schoolyard

Decontaminating a grass plot

</tr>
</tbody>
</table>

*1: Range from 25 to 75 percentile values of the air dose rate.
*2: Data measured at 50cm height in children’s living environment are not included.
*3: Average reduction rate of the air dose rate for different dose levels before decontamination.
(Reduction rate (%) = (1-air dose rate after decontamination / air dose rate before decontamination) x100.)
*4: Already in press release of “Announcement on ‘Effectiveness of decontamination work which is implemented by the national government and relevant municipalities in decontamination project’ (Jan. 18, 2013)”

### Original Data

- **Projects:** Mostly, decontamination projects after FY2012
  - (Projects by national government: 10 municipalities;
    Projects by municipalities: 90 municipalities in 8 prefectures)
- **Data measurement term:** Roughly from Mar. 2012 to Oct. 2013
- **Measured item:** Air dose rate (measured at 1m and 50cm heights; Unit: μSv/h)
- **Number of data:** About 250,000 (A pair of data collected before and after decontamination is counted as one item of data)
• Policy Framework
• Progress in Special Decontamination Area
• Progress in Intensive Contamination Survey Area
• Decontamination technology
• **New policies announced in Sep 2013**
• Efforts to secure Interim Storage Facility
MOE has announced new policies for two items below in September 2013.

1. Follow-up policy after decontamination work is completed
   Follow-up policy has newly been established by MOE, according to the completion of decontamination work based on the decontamination plans in several municipalities.

2. Decontamination policy in forest areas
   Decontamination in forest area has been limited to within 20 m from the residential area under the current policy. Taking into account voices from Fukushima that hope to widen decontamination target area, decontamination policy for forest areas is also renewed based on relevant results of research.
1. Follow up measures after completion of decontamination work based on a plan

(Confirmation of maintenance of decontamination effects)
- Conduct relevant monitoring so as to confirm whether air dose reduction by decontamination would be maintained.

(Follow-up decontamination work)
- Implement decontamination work in the case of that newly-found contaminated areas(*) or areas in which un-decontaminated points are found, while considering radiation level there.

(*) Supposing such area whose air dose rate is higher than that of surrounding area because contaminated soil, etc. is re-accumulated there associated with fallen leaves or rain water and, as a result, air dose rate goes up significantly after the decontamination.

- Require a careful judgment to decide the follow-up decontamination implementation, considering various circumstances of each case. MOE will publish guidance for it by analyzing actual cases.

(Others)
- Take relevant measures including risk communication matters based on the ongoing discussion at the Nuclear Emergency Response Headquarters on radiation protection measures.
- In regard with measures on rivers and lakes, monitoring will have been conducted.
2. Measures on forest areas

A. Around residential areas
   - Make an additional measure possible to remove organic residuals 5m in width from the edge in the case the effects of prior decontamination (by removing organic deposits such as fallen leaves 20m in width) is found to be limited.
   - Make an exceptional measure possible to widen the area of decontamination to over 20m in case relatively high air dose rate is monitored around the house even though prior decontamination has been done, supposing such a house located in a valley, etc.

   Reflected to “Decontamination Guidelines” (December, 2013)

B. Cultivating farm for mushroom
   - Make the implementation of standard decontamination method possible, which have been approved around residential areas (20m wide), in a case where cultivating business is expected to be sustained.

   Described a decontamination method clearly in “Q&A for decontamination” (October, 2013)

C. Forest in whole
   - Collaborative measures will be conducted by Ministry of the Environment and Forestry Agency.
     MOE: measures regarding monitoring on runoff and/or diffusion of contaminated soil as well as countermeasures against them
     Forestry Agency: measures to take proper forestry management

   Implementation planned in FY2014
“The Policy for accelerating Fukushima’s reconstruction from the nuclear disaster”
(Cabinet Decision, December 20, 2013)
Integrated and multi-tiered protective actions are taken by the related ministries in collaboration with each other. The ministries conduct, or continue to examine, measures of measuring and managing individual doses, reducing radiation exposure in various manners, and establishing a consultation system. With these measures, we continue to pursue the long-term goal (additional individual dose of 1mSv per year or below) for the returned evacuees.
URL; http://www.kantei.go.jp/foreign/96_abe/actions/201312/20gensiryoku_e.html

“Practical Measures for Evacuees to Return Their Homes” (Nuclear Regulation Authority, November 20, 2013)
One of the practical measures for evacuees to return their home is to focus on the individual dose. For the evacuees to return home, measures that contribute to measure, manage the individual dose, and to reduce radiation exposure of residents are suggested. Also, to establish a system of supporting the evacuees who choose to return home in a comprehensive manner, the necessity of allocating counseling staff and developing a system of supporting them was suggested.
• Policy Framework
• Progress in Special Decontamination Area
• Progress in Intensive Contamination Survey Area
• Decontamination technology
• New policies announced in Sep 2013
• Efforts to secure Interim Storage Facility
Oct., 2011  Ministry of the Environment announced the Basic Principles for Interim Storage Facility (ISF) (the roadmap), and explained to the heads of relevant municipalities

Dec., 2011  The Ministry requested Fukushima Pref. and 8 towns in Futaba County to examine location sites within Futaba county

Mar., 2012  The Ministry explained the Fukushima Prefecture and 8 towns that IFS may be located separately in 3 towns (Futaba, Okuma and Naraha)

Aug., 2012  The Ministry proposed the investigation for ISF to Fukushima Prefecture and 8 towns

Nov., 2012  The Governor of Fukushima Prefecture announced the acceptance of the investigation proposed by the Ministry at the consultation meeting with the mayors of Futaba County’s towns and villages

Efforts to secure Interim Storage Facility

※Main Contents

- The National Government shall secure, maintain and manage ISF
- The National Government shall make utmost efforts to start the operation of ISF within about 3 years (by January, 2015)
- Materials to be stored are limited to soil and waste generated in Fukushima prefecture
### Efforts to secure Interim Storage Facility

Illustration of Interim Storage Facility

ISF will be consisted of facilities with various functions

1. Storage Facility
2. Emplacement & Segregation Facility
3. Volume Reduction Facility
4. 24-hour monitoring Equipment (placed in several points, not specifically indicated in the figure)
5. R & D Facility
6. Public information Center

Scale of the whole facility (estimation)
Total storage volume ranges between 15-28 million m³, which is 12-23 times big as a baseball stadium (approx. 1.24 million m³)
## Concept of Structure of Storage Facility

### Measures to prevent water seeping into ground water
- **Type-I:** Seepage control and other infrastructure (Seepage control sheet and other infrastructure or low-permeability soil layer)
- **Type-II:** —
- **Waste:** Package

### Schematic View of Type-Ⅰ Soil Storage Facility

- **Drainage ditch**
- **Covering soil**
- **Groundwater monitoring**
- **Seeping water monitoring**
- **Shallow sump drainage (temporary)**

#### Applicable geography and geology
- **Alluvium:** Any low land
- **Mudstone formation and others:** Radioactive cesium concentration 8,000Bq/kg or less

#### Soil improvement (ensuring heavy machinery construction)*
- In the case of alluvium, soil improvement (approximately up to 1m depth) will be performed. In the case of mudstone formation, no action will be needed.

#### Water collection pipe (under water table)

#### Water treatment facility (temporary)

Concept of Structure of Storage Facility
