

(News Release)  
The Results of Additional Radioactive Material Monitoring  
of the Surface Water Bodies  
(October-December Samples)

<Simultaneously released to the Fukushima Prefecture Press Club>

Friday, May 31, 2013 Water Environment Division, Environment Management Bureau, Ministry of the Environment Direct line: 03-5521-8316 Switchboard: 03-3581-3351 Director: Masanobu Miyazaki (ext. 6610) Deputy Director: Saori Nagasawa (ext. 6614) Coordinator: Katsuhiko Sato (ext. 6628)
---

In accordance with the Comprehensive Radiation Monitoring Plan determined by the Monitoring Coordination Meeting, the Ministry of the Environment (MOE) is continuing to monitor radioactive materials in water environments (surface water bodies (rivers, lakes and headwaters, and coasts), etc.).

To date, monitoring of radioactive iodine and radioactive cesium has been carried out and their results have been released from time to time. Additionally, monitoring of radiostrontium in sediment has been carried out at various locations (sampling period: October-December, 2012; locations in Miyagi Prefecture, Fukushima Prefecture, Ibaraki Prefecture, Tochigi Prefecture, Gunma Prefecture, Chiba Prefecture, etc.), and the results are released here.

The monitoring results of radioactive materials in surface water bodies carried out to date can be found at the following web page: <http://www.env.go.jp/jishin/rmp.html#monitoring>

## 1. Monitoring Overview

### (1) Monitoring Locations

Among the survey locations in each prefecture, those locations of which readings of radioactive cesium in sediment were relatively high:

- Miyagi Prefecture: 7 locations (Rivers 3, Lakes and headwaters 2, Coasts 2)
- Fukushima Prefecture: 44 locations (Rivers 11, Lakes and headwaters 21, Coasts 12)
- Ibaraki Prefecture: 5 locations (Rivers 2, Lakes and headwaters 3)
- Tochigi Prefecture, Gunma Prefecture: 2 locations each (River 1, Lake and headwater 1)
- Chiba Prefecture: 4 locations (Rivers 2, Lakes and headwaters 2)
- Tokyo Prefecture: 1 location (Coast)

In total: 65 locations

### (2) Monitoring item

Radiostrontium (Sr-90) in sediment

## 2. Outline of Results

Except for some locations in the evacuation order areas, the readings of radiostrontium (Sr-90) were within the range of measurements (soil samples) taken before the accident.

Sr-90 concentration detected in sediment in this additional monitoring: 1.1-93Bq/kg (dried mud)

\*Readings of Sr-90 before the accident in Japan (soil sample): 0.20-14Bq/kg (dry)
