Results of the FY2006 Water Quality Survey of Public Water Areas

The Ministry of the Environment (MOE) has calculated and collated results of the nationwide water quality survey of public water areas implemented by the national government in FY2006, pursuant to the Water Pollution Control Law. The outline is as follows.

1. Health Item

Most of the monitoring points have achieved the environmental quality standards (hereinafter referred to as "the EQSs") for the 26 human health items with the EQS compliance rate reaching 99.3%, which increased by 0.2% compared to the previous year.

2. Living Environment Items

In terms of the compliance with the EQSs for BOD and COD, typical indicators of water quality for organic contamination, the overall compliance rate was 86.3%, which increased by 2.9% compared to the previous year, reaching a record-high level, with 91.2% for rivers (up 4.0%), 55.6% for lakes and reservoirs (up 2.2%) and 74.5% for sea and coastal areas (down 1.5%). The compliance rate of rivers reached a record-high level as a result of

improvement efforts, while that of lakes and reservoirs remains low.

(2) The EQS compliance rate for total nitrogen and total phosphorus in lakes and reservoirs was 45.9%, which decreased by 0.7% compared to the previous year. It still remains low. As for sea and coastal areas, the EQS compliance rates for total nitrogen and phosphorus was 80.3%, which decreased by 1.9% compared to the previous year.
