4.2.1.	<i>Approaches to projection.....</i>	<i>77</i>
4.2.2.	<i>Estimation method for energy-originated CO₂ emissions</i>	<i>77</i>
4.2.3.	<i>Estimation method for non-energy-originated CO₂, CH₄, N₂O and Fluorinated gases.....</i>	<i>78</i>
4.2.4.	<i>Estimation method for the amount of carbon sink in forests.....</i>	<i>79</i>
CHAPTER 5	PROVISION OF FINANCIAL TECHNOLOGICAL AND CAPACITY-BUILDING SUPPORT TO DEVELOPING COUNTRY PARTIES	81
5.1.	FINANCE.....	81
5.1.1.	<i>National approach to tracking and reporting provision of support.....</i>	<i>82</i>
5.1.2.	<i>Meeting Developing Country Needs.....</i>	<i>82</i>
5.1.3.	<i>Assistance through Bilateral and Regional Frameworks and Multilateral Channels.....</i>	<i>83</i>

5.2. TECHNOLOGY DEVELOPMENT AND TRANSFER	104
5.2.1. <i>Innovation</i>	104
5.2.2. <i>Emissions Reduction in Oversea Countries by Diffusing Technologies</i>	104
5.3. CAPACITY-BUILDING	111

Chapter 1 GHGs Emissions and Trends

1.1. Description and Interpretation of Emission and Removal Trends for Aggregate GHGs

1.1.1. Overview of GHG Inventory

1.1.1.1. Background Information on Japan's Greenhouse Gas Inventory

Japan reports greenhouse gas (GHG) inventories that contain information on emissions and removals of GHGs, including indirect GHGs and SO₂ in Japan, on the basis of Articles 4 and 12 of the United Nations Framework Convention on Climate Change (UNFCCC) and of Article 7 of the Kyoto Protocol. Japan's estimation methodologies for GHG inventories are in line with the *Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories* (hereafter, *Revised 1996 IPCC Guidelines*) which were developed by the Intergovernmental Panel on Climate Change (IPCC). In addition, *Good Practice Guidance and Uncertainty Management in National Greenhouse Gas Inventories (2000)* (hereafter, *GPG (2000)*) and *Good Practice Guidance for Land Use, Land-Use Change and Forestry* (hereafter, *GPG-LULUCF*) are applied to improve transparency, consistency, comparability, completeness, and accuracy of the inventories. Annual inventories are reported in accordance with the *UNFCCC Reporting Guidelines on Annual Inventories* (FCCC/SBSTA/2006/9) adopted by the Conference of the Parties. Supplementary information under Article 7, Paragraph 1 of the Kyoto Protocol is reported in accordance with *Annotated outline of the National Inventory Report including reporting elements under the Kyoto Protocol* prepared by the UNFCCC secretariat.

Greenhouse gases reported in the GHG inventories are carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF₆), and precursors such as nitrogen oxides (NO_x), carbon monoxide (CO), non-methane volatile organic compounds (NMVOC), and sulfur dioxide (SO₂) are also reported.

1.1.1.2. Brief General Description of Methodologies

The methodology used in the estimation of GHG emissions or removals is basically in accordance with the *Revised 1996 IPCC Guidelines*, the *GPG (2000)*, and the *GPG-LULUCF*. Country-specific methodologies are also used for some categories in order to reflect the actual emission status in Japan. Results of the actual measurements or estimates based on research conducted in Japan are used to determine the emissions factors (country-specific emissions factors). The default values given in the *Revised 1996 IPCC Guidelines*, the *GPG (2000)*, and the *GPG-LULUCF* are used for the estimation of emissions that are assumed to be quite low, and where the possibility of emission from a given source is uncertain.

1.1.1.3. Sectors

Japan's national GHG inventory is composed of 6 sectors: Energy Sector; Industrial Processes; Sectors that use solvents and other products; Agriculture; Land Use, Land-Use Change and Forestry; and Waste.

1.1.1.3.a. Energy Sector

Emissions from the energy sector consist of two main categories: fuel combustion and fugitive emissions from fuels. Fuel combustion includes emissions released into the atmosphere when fossil fuels (e.g., coal, oil products, and natural gas) are combusted. Fugitive emissions are intentional or unintentional releases of gases from fossil fuels by anthropogenic activities. In Japan, fossil fuels are used to produce energy for a wide variety of purposes (e.g., production, transportation, shipment, and consumption of energy products), and not only CO₂ but also CH₄, N₂O and indirect greenhouse gases such as NO_x (Nitrogen Oxide), CO (Carbon Monoxide) and NMVOC (Non-Methane Volatile Organic Compounds) are emitted in the process.

1.1.1.3.b. Industrial Processes

The Industrial Processes sector deals with GHG emissions resulting from chemical and physical transformations in industrial processes. Specially, CO₂, CH₄ and N₂O emissions from mineral products (e.g., cement production), the chemical industry (e.g., ammonia production), metal production (e.g., iron and steel production), and HFC, PFC and SF₆ emissions at the stage of production, use and discharge are estimated.

1.1.1.3.c. Solvents and other products use

The Solvents and other products use sector deals with N₂O emissions resulting from the use of anesthetics (e.g., laughing gas). In addition, NMVOC emission from solvent production and uses such as paint, metal cleansing, and dry cleaning are estimated.

1.1.1.3.d. Agriculture

The Agriculture sector deals with GHG emissions resulting from agricultural activities. In particular, Specially, CH₄ as the result of enteric fermentation, CH₄ and N₂O generated in the treatment of manure excreted by cattle etc, CH₄ emitted from paddy fields cultivated for rice production, N₂O emitted from agricultural soil, and CH₄ and N₂O from field burning of agricultural waste, etc., are estimated.

1.1.1.3.e. Land Use, Land-Use Change and Forestry

The Land use, land-use change and forestry (LULUCF) sector deals with GHG emissions and removals resulting from land use such as forestry activities and land-use change. Japan classifies its national land into six categories—forest land, cropland, grassland, wetlands, settlements, and other land—and subdivides each of these into two subcategories by distinguishing them on the basis of whether or not land conversion has occurred, in accordance with the *GPG-LULUCF*. GHG emissions and removals in this sector cover carbon stock changes in five carbon pools (aboveground biomass, belowground biomass, dead wood, litter, and soil), direct N₂O emissions from N fertilization, N₂O emissions from drainage of soils, N₂O emissions from disturbance associated with land-use conversion to cropland, CO₂ emissions from agricultural lime application, and non-CO₂ emissions from biomass burning.

1.1.1.3.f. Waste

In the waste sector, GHG emissions from the treatment and disposal of waste are estimated for solid waste disposal on land, wastewater handling, waste incineration, and other processes, in accordance with each treatment process. The waste to be covered in this sector is waste as defined in the Revised 1996 IPCC Guidelines. In the case of Japan, waste not only includes municipal waste and industrial waste as defined by the Waste Disposal and Public Cleansing Law, but also recyclables and valuables that are re-used within a company.

1.1.2. Trends in GHG Emissions and Removals

Total GHG emissions in FY2011^{1,2} (excluding LULUCF³) amounted to 1,308 million tonnes (in CO₂ eq.). They increased by 8.5% compared to the emissions in FY1990⁴ (excluding LULUCF). Compared to the emissions in the base year under the Kyoto Protocol⁵, they increased by 3.7%.

Figure 1-1 Trends in GHG Emissions and Removals in Japan⁶

Carbon dioxide emissions in FY2011 amounted to 1,241 million tonnes (excluding LULUCF), accounting for 94.9% of total GHG emissions. They increased by 8.7% from FY1990 and by 4.2% compared to the previous year. Carbon dioxide removals⁷ in FY2011 amounted to 75.4 million tonnes,

¹ “FY” (fiscal year), from April of the reporting year through March of the next year, is used because CO₂ is the primary GHG emission and it is estimated on a fiscal year basis. “CY” stands for calendar year.

² The sum of CO₂, CH₄, N₂O, HFCs, PFCs and SF₆ emissions converted to CO₂ equivalents, multiplied by their respective global warming potential (GWP). The GWP is a coefficient by means of which greenhouse gas effects of a given gas are made relative to those of an equivalent amount of CO₂. The coefficients are subjected to the *Second Assessment Report* (1995) issued by the Intergovernmental Panel on Climate Change (IPCC).

³ Abbreviation of “Land Use, Land-Use Change and Forestry”

⁴ The sum of CO₂, CH₄ and N₂O emissions converted to CO₂ equivalents multiplied by their respective GWP.

⁵ Japan’s base year under the Kyoto Protocol for CO₂, CH₄, and N₂O emissions is FY1990, while CY1995 is the base year for emissions of HFCs, PFCs, and SF₆.

⁶ Actual emissions of HFCs, PFCs, and SF₆ in the period from CY1990 to 1994 are not estimated (NE). Potential emissions are reported in common reporting format (CRF) for CY1990 to 1994.

⁷ Since the inventory to be submitted under the UNFCCC reports all GHG emissions and removals from the LULUCF sector, these values do not correspond to emissions and removals which can be accounted for compliance under the Kyoto

which were equivalent to 5.8% of total GHG emissions. They increased by 8.4% from FY1990 and decreased by 0.4% compared to the previous year. Methane emissions in FY2011 (excluding LULUCF) amounted to 20.3 million tonnes (in CO₂ eq.), accounting for 1.6% of total GHG emissions. They decreased by 36.8% from FY1990 and by 2.1% compared to the previous year. Nitrous oxide emissions in FY2011 (excluding LULUCF) amounted to 21.6 million tonnes (in CO₂ eq.), accounting for 1.7% of total GHG emissions. They decreased by 31.5% from FY1990 and by 1.7% compared to the previous year. Emissions of hydrofluorocarbons in CY2011 amounted to 20.5 million tonnes (in CO₂ eq.), accounting for 1.6% of total GHG emissions. They increased by 1.0% from CY1995 and by 11.8% compared to the previous year. Emissions of perfluorocarbons in CY2011 amounted to 3.0 million tonnes (in CO₂ eq.), accounting for 0.2% of total GHG emissions. They decreased by 78.9% from CY1995 and by 11.5% compared to the previous year. Sulfur hexafluoride emissions in CY2011 amounted to 1.6 million tonnes (in CO₂ eq.), accounting for 0.1% of total GHG emissions. They decreased by 90.3% from CY1995 and by 12.1% compared to the previous year.

Protocol (for "forest management", 13 million carbon tonnes is given as the upper limit for Japan in the appendix to the annex to decision 16/CMP.1) .

* KPBY: Base year of Kyoto Protocol

* NA: Not applicable

* NE: Not estimated

* LULUCF: Land Use, Land-Use Change and Forestry

* CH₄ and N₂O emissions in Table 1 include emissions from LULUCF based on the estimation method decided by the UNFCCC. On the other hand, since emissions from LULUCF are regarded as RMUs (removal units) according to Article 3.3 of the Kyoto Protocol, they are not included in GHGs emissions based on the Kyoto Protocol (refer annex 8 table 1).

Japan's total emissions showed a tendency towards slightly increasing from being constant from the mid-1990s to FY2007, and reached the highest emission level on record. From the mid-1990s to

FY2007, CO₂ emission demonstrates the increasing trend due to the increase of electricity consumption etc., whereas other GHGs except CO₂ decreased. However, with the impact of the global economic crisis that occurred in 2008, the recession led to reduced energy consumption, and Japan's total emissions were greatly reduced for the two consecutive years (FY2008, FY 2009). With the recovery from the recession, energy consumption increased with production activities in the manufacturing sector, and total emissions began to increase in FY2010. Total emissions continued to increase in FY2011, and the main driving factor was the increase in fossil fuel consumption in response to the expansion of thermal power generation due to the suspension of nuclear power plants, although the amount of manufacturing production decreased due to the influence of the Great East Japan Earthquake, which occurred in March 2011.

1.1.3. Description of Emission and Removal Trends by Gas

1.1.3.1. CO₂

1.1.3.1.a. Trends in CO₂ Emissions

Carbon dioxide emissions in FY2011 amounted to 1,241 million tonnes (excluding LULUCF), accounting for 94.9% of total GHG emissions. They increased by 8.7% from FY1990 and by 4.2% compared to the previous year.

Figure 1-2 Trends in CO₂ Emissions

CO₂ emissions showed a tendency to increase from FY1990 to FY2007. Emissions until the early 2000s increased due to factors such as the enlargement of cars, increasing traffic volume, and increasing energy demand in the commercial and residential sectors. The main factors driving the increase in CO₂ emissions since the 2000s have been continuous electricity consumption and the expansion of thermal power generation in response to the low operating rate of nuclear plants. After a peak in FY2007, CO₂ emissions decreased for two years in FY2008 and FY2009 due to the impact of the global economic crisis that occurred in FY2008. In the recovery from the recession, because of an increase in energy consumption occurred due to the recovery of production activities in the manufacturing sector, total CO₂ emissions began to increase in FY2010.

The breakdown of CO₂ emissions in FY2011 shows that fuel combustion accounts for 95.6%, followed by industrial processes (3.3%) and the waste sector (1.0%). Regarding the breakdown of CO₂ emissions within the fuel combustion category, energy industries account for 37.6%, followed by manufacturing industries and construction at 27.0%, transport at 17.9%, and other sectors⁸ at 13.1%. The main factor driving the increase in CO₂ emissions compared to the previous year was the increased consumption of fossil fuel in response to the expansion of thermal power generation, although the amount of manufacturing production decreased due to the influence of the Great East Japan Earthquake, and other factors.

Looking at the changes in FY2011 emissions compared to FY1990 and the previous year by sector, emissions from fuel combustion in the energy industries increased by 43.9% from FY1990 and by 15.1% compared to the previous year. The main factors driving the increase in CO₂ emissions from FY1990 are the increase in electricity consumption and the expansion of thermal power generation in response to the suspension of nuclear plants. CO₂ emissions from fuel combustion in the manufacturing industries and construction decreased by 9.7% (compared to FY1990) and by 2.2% (compared to the previous year). Emissions had leveled off, but greatly reduced due to the impact of the global economic crisis in 2008. Emissions from the fuel combustion in the transport sector increased by 5.2% (compared to FY1990) and decreased by 1.5% (compared to the previous year). The main factor driving the increase in CO₂ emissions until the early 2000s was the increase in demand for passenger transportation, compensating for a decrease in the volume of freight transportation. However, these emissions have been on the decline since the early 2000s due to the increased volume of cars with good fuel efficiency. Emissions from the fuel combustion in other sectors (commercial and other, and residential) increased by 0.6% from FY1990 and decreased by 0.5% compared to the previous year. Emissions have tended to decrease in recent years, but the main factor for this is a shift to electricity in energy usage.

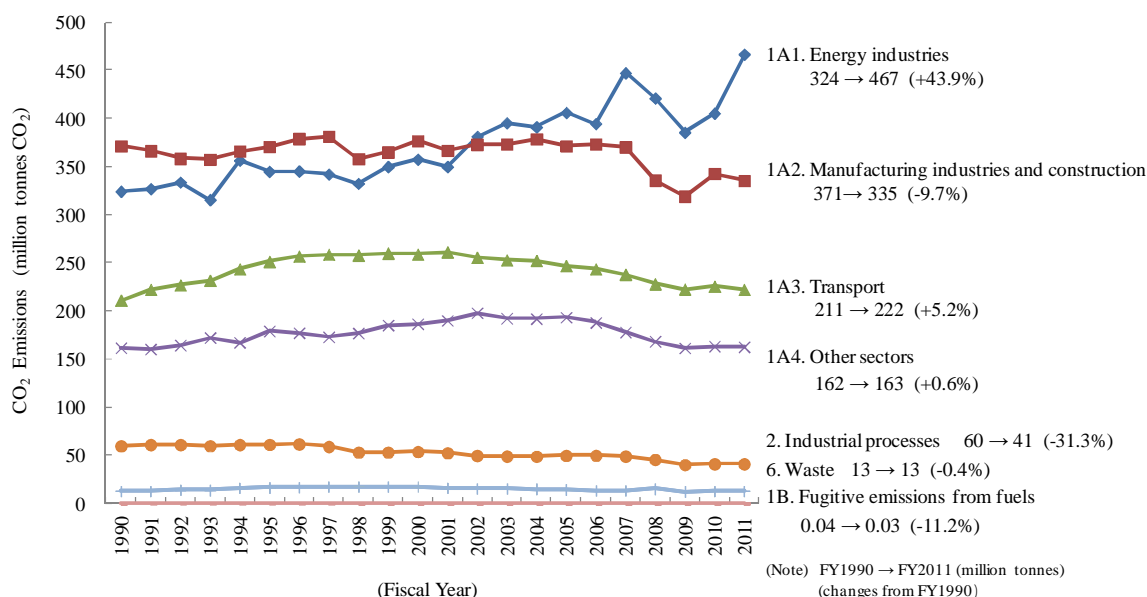

Figure 1-3 Trends in CO₂ Emissions in Each Sector

(Figures in brackets indicate increases or decreases relative to FY1990 values)

⁸ This covers emissions from commercial/institutional, residential and agriculture/forestry/fisheries.

Table 1-2 Trends in CO₂ Emissions and Removals in Each Sector

Category	1990	1995	2000	2005	2008	2009	2010	2011
1A. Fuel combustion	1,068,260	1,145,769	1,180,044	1,217,697	1,153,043	1,088,805	1,136,982	1,186,604

Figure 1-4 The Power Generation by Type and CO₂ Emissions(10 General Electricity Utilities, Including Receiving Power from Other Companies)

Source of Power Generation by Type

FY1990–FY2009: calculated using the *Summary of electric power development*(Agency for Natural Resources and Energy);FY2010–FY2011: calculated using *The composition ratio of electric power generation by power generation type in FY2011* (The Federation of Electronic Power Companies of Japan, June 13, 2012)

Sources of CO₂ emissions

FY1990–FY2010: *Efforts for preventing global warming* (The Federation of Electronic Power Companies of Japan), documents by the of Resource and Energy Working Group of the Global Environmental Subcommittee under the Environment Division of the Industrial Structure Council (FY2011)

FY2011: *Environmental Action Plan* (The Federation of Electronic Power Companies of Japan, September 2012)

Figure 1-5 Trends in the Rate of Utilization of Nuclear Plants

Source: *The composition ratio of electric power generation by power generation type in FY 2011* (The Federation of Electronic Power Companies of Japan, June 13, 2012), *Electricity Generated and Purchased (Bulletin)* (The Federation of Electronic Power Companies of Japan)

Carbon dioxide removals in FY2011 amounted to 75.4 million tonnes, which was equivalent to 5.8% of total GHG emissions. They increased by 8.4% from FY1990 and decreased by 0.4% compared to the previous year.

1.1.3.1.b. CO₂ Emissions per Capita, CO₂ Emissions per Unit of GDP

Carbon dioxide emissions per capita in FY2011 amounted to 9.71 tonnes, which was an increase of 5.2% from FY1990, and an increase of 4.4% compared to the previous year.

Figure 1-6 Trends in Total CO₂ Emissions and CO₂ Emissions per Capita

Source of population data: Source of population data: Statistics Bureau, Ministry of Internal Affairs and Communications, *Population Census and Population Estimates*

Carbon dioxide emissions per unit of GDP (million yen) in FY2011 amounted to 2.41 tonnes, which was a decrease of 4.0% from FY1990 and an increase of 3.9% compared to the previous year.

Figure 1-7 Trends in CO₂ Emissions per Unit of GDP

Source of GDP data: Cabinet Office, Government of Japan, *Annual Report on National Accounts*

Figure 1-8 shows trends of population, GDP, CO₂ emissions per capita, and CO₂ emissions per unit of GDP. CO₂ emissions per capita continuously exceeded the FY1990 level between FY1990 and FY2008, but it fell under the FY1990 level in FY2009, due to a significant decrease in CO₂ emissions. GDP and CO₂ emissions per unit of GDP show the opposite trend, and CO₂ emissions per unit of GDP has continued to be below FY1990 the level since the early 2000s.

Figure 1-8 Trends in Population, GDP, CO₂ Emissions per Capita, CO₂ Emissions per Unit of GDP (FY1990=100)

Source of population data: Source of population data: Statistics Bureau, Ministry of Internal Affairs and Communications, *Population Census and Population Estimates*, Source of GDP data: Cabinet Office, Government of Japan, *Annual Report on National Account*

1.1.3.2. CH₄

Methane emissions in FY2011 amounted to 20.3 million tonnes (in CO₂ eq., including LULUCF), accounting for 1.6% of total GHG emissions. They decreased by 36.8% from FY1990 and by 2.1% compared to the previous year. Their decrease since FY1990 was mainly a result of a decrease in emissions from the waste sector (53.2% reduction compared to FY1990) due to a decrease in waste disposal on land, etc.

The breakdown of the FY2011 emissions shows that the largest source was enteric fermentation accounting for 32%. This was followed by rice cultivation (27%) and solid waste disposal on land (15%). Their decrease since the previous year was a result of a decrease in emissions from the waste sector (4.8% reduction compared to the previous year) due to a decrease in waste disposal on land, etc., and from the agricultural sector (1.0% reduction compared to the previous year) due to a decrease in emission from enteric fermentation.

1.1.3.3. N₂O

Nitrous oxide emissions in FY2011 amounted to 21.6 million tonnes (in CO₂ eq., including LULUCF), accounting for 1.7% of total GHG emissions.

Their decrease from FY1990 was mainly a result of a decrease in emissions from industrial processes (87.7% reduction compared to FY1990) due to the operation of N₂O abatement equipment in adipic acid production plants, and from the agricultural sector (19.8% reduction compared to FY1990) due to a decrease in the livestock population and the use of nitrogen fertilizers applied to cropland.

There was a sharp decline in emissions from industrial processes from FY1998 to 1999, as N₂O abatement equipment came on stream in adipic acid production plants in March 1999. However, N₂O emissions increased in FY2000 because of a decrease in the efficiency of the equipment; emissions decreased again in FY2001 with the resumption of normal operation.

The breakdown of the FY2011 emissions shows that the largest source was agricultural soils, which accounted for 27%, followed by manure management (25%) and fuel combustion (stationary sources) (19%). Their decrease from the previous year was mainly a result of a decrease in emissions from industrial processes (-26.9% compared to the previous year) due to a decrease in emissions from adipic acid production.

1.1.3.4. HFCs

Emissions of hydrofluorocarbons in CY2011⁹ amounted to 20.5 million tonnes (in CO₂ eq.), accounting for 1.6% of total GHG emissions. They increased by 1.0% from CY1995, and by 11.8% compared to the previous year. Their increase from CY1995 was mainly a result of an increase in emissions from refrigerants (+2,203%) due to the substitution of HCFC, an ozone depleting substance, with HFCs. This occurred despite regardless of a decrease in emissions of HFC-23 (-99.9%), a by-product of HCFC-22 production, due to regulation under the Act on the Protection of the Ozone Layer Through the Control of Specified Substances and Other Measures.

The breakdown of the CY2011 emissions shows that the largest source was refrigerants for refrigeration and air conditioning equipment accounting for 95%. This was followed by aerosols and metered dose inhalers (MDIs) (3%). Their increase from the previous year was mainly a result of a 12.9% increase in emissions from refrigerants due to the substitution of HCFC with HFCs.

Figure 1-11 Trends in HFCs Emissions

⁹ Emissions of HFCs, PFCs and SF₆ are estimated on a calendar year (CY) basis.

1.1.3.5. PFCs

Emissions of perfluorocarbons emissions in CY2011 amounted to 3.0 million tonnes (in CO₂ eq.), accounting for 0.2% of total GHG emissions. They decreased by 78.9% from CY1995, and by 11.5% compared to the previous year. Their decrease from the CY1995 level (-87.5%) was mainly a result of a decrease in emissions from solvents by using substitute materials as solvents. The breakdown of the CY2011 emissions shows that the largest source was semiconductors for manufacturing accounting for 51%. This was followed by solvents such as those used for washing metals (43%) and fugitive emissions of PFCs (6%). The decrease from the previous year was mainly a result of a decrease in emissions from the production of semiconductors (-15.0%).

Figure 1-12 Trends in PFCs Emissions

Total	14,271	9,583	6,991	4,615	3,265	3,409	3,016

1.1.3.6. SF₆

Sulfur hexafluoride emissions in CY2011 amounted to 1.6 million tonnes (in CO₂ eq.), accounting for 0.1% of total GHG emissions. They decreased by 90.3% from CY1995, and by 12.1% compared to the previous year. Their decrease from the CY1995 level (-93%) was mainly a result of a decrease in emissions from electrical equipment, due to the strengthening of the management of gases, largely in electric power companies.

The breakdown of the CY2011 emissions shows that the largest source was electrical equipment accounting for 45%. This was followed by semiconductor manufacture (35%) and aluminum and magnesium foundries (12%). The decrease from the previous year was mainly a result of a

decrease in emissions from the production of semiconductors (-19.4%).

Figure 1-13 Trends in SF₆ Emissions

1.1.4. Description of Emission and Removal Trends by Sector

The breakdown of GHG emissions and removals in FY2011 by sector¹⁰ shows the energy sector accounted for 91.3% of total GHG emissions. This was followed by industrial processes (5.1%), agriculture (1.9%), waste (1.6%), and solvents and other product use (0.01%).

Removals by LULUCF in FY2011 were equivalent to 5.8% of total GHG emissions.

¹⁰ This implies "Category" as indicated in the *Revised 1996 IPCC Guidelines* and CRF.

1.1.4.1. Energy

Emissions from the energy sector in FY2011 amounted to 1,194 million tonnes (in CO₂ equivalents). They increased by 10.7% from FY1990 and by 4.3% compared to the previous year.

The breakdown of the FY2011 emissions shows that CO₂ from fuel combustion accounted for 99.3%. The largest source within fuel combustion was liquid fuel CO₂, which accounted for 43%, followed by solid fuel CO₂ (35%) and gaseous fuel CO₂ (21%).

For the trend of emissions, please refer to the description of trends in CO₂ emissions of fuel combustion, which accounted for most of the emissions (See 1.1.3.1. CO₂).

1.1.4.2. Industrial Processes

Emissions from the industrial processes sector¹¹ in FY2011 amounted to 67.2 million tonnes (in CO₂ eq.). They decreased by 2.0% from FY1990, and increased by 2.0% compared to the previous year.

The breakdown of GHG emissions from this sector in FY2011 shows that the largest source was mineral products such as CO₂ emissions from limestone in cement production, accounting for 57%.

¹¹ Actual emissions of HFCs, PFCs, and SF₆ are not estimated (NE) for CY1990 to 1994.

This was followed by the consumption of HFCs (30%) and the consumption of PFCs (4%). The increase from the previous year was a result of an increase in emissions from refrigerants due to the substitution of HCFC for HFCs.

The main driving factors for decreases in CO₂, CH₄ and N₂O emissions from FY1990 were the decrease in CO₂ emissions from cement production as clinker production declined, and the decrease in N₂O emissions from adipic acid production as N₂O abatement equipment came on stream. The main driving factors for decreases in emissions of PFCs and SF₆ emissions from CY1995 were the promotion of substitute materials use and of the capture and destruction of these gases.

1.1.4.3. Solvent and Other Product Use

Emissions from the solvents and other product use sector in FY2011 amounted to 100,000 tonnes (in

CO₂ eq.). They decreased by 66.2% from FY1990, and by 1.8% compared to the previous year. The only substance subject to estimation in this sector is laughing gas (N₂O) used as a general anesthetic in hospitals. Their trend since FY1990 and the previous year was a result of a decrease in emissions from laughing gas (N₂O) due to the substitution of anesthetics

Figure 1-17 Trends in GHG Emissions from the Solvent and Other Product Use Sector

1.1.4.4. Agriculture

Emissions from the agriculture sector in FY2011 amounted to 25.4 million tonnes (in CO₂ eq.). They decreased by 18.3% from FY1990 and by 0.5% compared to the previous year.

The breakdown of the FY2011 emissions from this sector shows that the largest source was the enteric fermentation, accounting for 26%. This was followed by agricultural soils (23%) as a result of the application of nitrogen-based fertilizer, and rice cultivation (21%). The decrease from the previous year was mainly the result of a decrease in CH₄ emissions from enteric fermentation and CH₄ or N₂O emissions from manure management, due to a decline in the livestock population. The main driving factor for the decrease in emissions from FY1990 was the decrease in CH₄ emissions from rice cultivation as a result of crop a decline in acreage, and the decrease in N₂O emissions from agricultural soils, because the amount of nitrogen fertilizers applied to cropland had decreased.

1.1.4.5. Land Use, Land Use Change and Forestry (LULUCF)

Net removals (including CO₂, CH₄ and N₂O emissions) from the LULUCF sector in FY2011 amounted to 75.4 million tonnes (in CO₂ eq.). They increased by 8.5% from FY1990 and decreased by 0.4% compared to the previous year. The declining trend in removals in recent years has largely been due to the maturity of Japanese forests. Emissions from cropland and settlements have decreased from FY1990 because land-use conversions to those land-use categories became lower due to factors such as economic depression and the decline of agriculture.

The breakdown of the FY2011 emissions and removals from this sector shows that the largest sink was the forest land, and its removals amounted to 78.1 million tonnes accounting for 104% of this sector's net total emissions/removals.

1.1.4.6. Waste

Emissions from the waste sector in FY2011 amounted to 20.6 million tonnes (in CO₂ eq.). They

decreased by 20.8% from FY1990 and by 1.8% compared to the previous year.

The breakdown of the FY2011 emissions from this sector shows that the largest source was waste incineration (CO₂), associated with waste derived from fossil fuels such as waste plastic and waste oil, accounting for 60%. This was followed by solid waste disposal on land (CH₄) (15%) and waste incineration (N₂O) (8%), which are associated with waste substances including those that do not have a fossil fuel origin.

The main driving factor for the decrease in emissions from FY1990 was the decrease in CH₄ emissions from solid waste disposal on land. This was a result of decrease in the amount of disposal of biodegradable waste due to improvement of the volume reduction ratio by intermediate treatment under the Waste Management and Public Cleansing Act and other acts. The decrease from the previous fiscal year was also for the same reason.

Figure 1-20 Trends in GHG Emissions from the Waste Sector

1.1.4.7. Description of Emission Trends for Indirect GHGs and SO₂

Under the UNFCCC, emissions reporting is required not only for the 6 types of GHGs (CO₂, CH₄, N₂O, HFCs, PFCs, and SF₆) that are controlled by the Kyoto Protocol, but also for emissions of

indirect GHGs (NO_x, CO, and NMVOC) as well as SO₂. Their emission trends are indicated below. Nitrogen oxide (NO_x) emissions in FY2011 amounted to 1,679,000 tonnes. They decreased by 17.8% from FY1990 and by 3.4% compared to the previous year. Carbon monoxide (CO) emissions in FY2011 amounted to 2,409,000 tonnes. They decreased by 46.3% from FY1990 and by 5.6% compared to the previous year. Non-methane volatile organic compounds (NMVOC) emissions in FY2011 amounted to 1,574,000 tonnes. They decreased by 19.0% from FY1990 and increased by 0.2% compared to the previous year. Sulfur dioxide (SO₂) emissions in FY2011 amounted to 941,000 tonnes. They decreased by 25.0% from FY1990 and by 1.2% compared to the previous year.

Figure 1-21 Trends in Emissions of Indirect GHGs and SO₂

1.1.5. Emissions and Removals from KP-LULUCF Activities

The net removals from KP-LULUCF activities in FY2011 amounted to 52.2 million tonnes (in CO₂ eq.). The breakdown of emissions and removals from each activity in the first commitment period of the Kyoto Protocol is shown in Table 1-14.

Table 1-14 Accounting Summary for Activities under Articles 3.3 and 3.4 of the Kyoto Protocol (CRF information table)

Greenhouse gas source and sink activities	Base year	Net emissions/removals					Accounting parameters	Accounting quantity
		2008	2009	2010	2011	Total		
(Gg CO ₂ equivalent)								
A. Article 3.3 activities								
A.1. Afforestation and Reforestation								-1786.15
A.1.1. Units of land not harvested since the beginning of the commitment period		-426.83	-441.27	-456.02	-462.04	-1,786.15		-1786.15
A.1.2. Units of land harvested since the beginning of the commitment period								
A.2. Deforestation		2,644.68	3,277.13	5,067.44	2,021.92	13,011.18		13011.18
B. Article 3.4 activities								
B.1. Forest management (if elected)		-46,917.90	-48,732.58	-53,286.10	-52,606.06	-201,542.65		-201542.65
3.3 offset							11,225.03	-11225.03
FM cap							238,333.33	-190317.62
B.2. Cropland management (if elected)	NA	NA	NA	NA	NA	NA	NA	NA
B.3. Grazing land management (if elected)	NA	NA	NA	NA	NA	NA	NA	NA
B.4. Revegetation (if elected)	-77.87	-1080.00	-1110.44	-1128.23	-1141.54	-4460.21	-311.49	-4148.72

The net removals by FM after application of the Article 3.3 offset are lower than the upper limit (13 Mt-C × 5 [238,333 Gg-CO₂]) given in the Annex to Decision 16/CMP.1.

Since the total of anthropogenic GHG emissions from sources and removals by sinks in managed forests since 1990 is larger than the net source of emissions incurred under Article 3.3, the offset rule according to Paragraph 10 of the Annex to Decision 16/CMP.1 is applied to Japan.

Methodologies for estimation and accounting of Article 3.3 and 3.4 activities are continuously reviewed. The values in Table 2-14 are estimated using current methodologies, and are only reported but not accounted for in the 2013 submission, since Japan elected accounting for the entire commitment period. The issuance of removal units from LULUCF activities under the Kyoto Protocol is to be performed at the end of the first commitment period.

The total values and results of summing up each figure are not always the same because of the difference in display digits.

1.2. Brief description of National Inventory Arrangements

1.2.1. Description of Japan's Institutional Arrangement for GHG Inventory Preparation

The Ministry of the Environment (MOE), with the cooperation of relevant ministries, agencies and organizations, prepares Japan's national inventory and compiles supplementary information required under Article 7.1, which is submitted annually to the Conference of the Parties through the UNFCCC Secretariat in accordance with the UNFCCC and the Kyoto Protocol.

The MOE assumes overall responsibility for the national inventory and therefore makes every effort to improve the quality of the inventory. The MOE organizes Committee for Greenhouse Gas Emission Estimation Methods ("the Committee") in order to integrate the latest scientific knowledge into the inventory and to modify it based on more recent international provisions. The estimation of GHG emissions and removals, the key category analysis and the uncertainty assessment are then carried out while taking into consideration the decisions of the Committee. Substantial activities, such as the estimation of emissions and removals and the preparation of the Common Reporting Formats (CRF) and National Inventory Report (NIR), are done by the Greenhouse Gas Inventory Office of Japan (GIO), which belongs to the Center for Global Environmental Research of the National Institute for Environmental Studies. The relevant ministries, agencies, and organizations provide the GIO with the appropriate data (e.g., activity data, emission factors, and GHG emissions and removals) through the compilation of various statistics and also provide relevant information on supplementary information required under Article 7.1. The relevant ministries and agencies check and verify the inventories (i.e., CRF, NIR), including the spreadsheets that are actually utilized for the estimation, as part of the Quality Control (QC) activities.

The checked and verified inventories are determined as Japan's official values. The inventories are then published by the MOE and are submitted to the UNFCCC Secretariat by the Ministry of Foreign Affairs.

Figure 1-22 shows the overall institutional arrangement for Japan's inventory preparation as identified above.

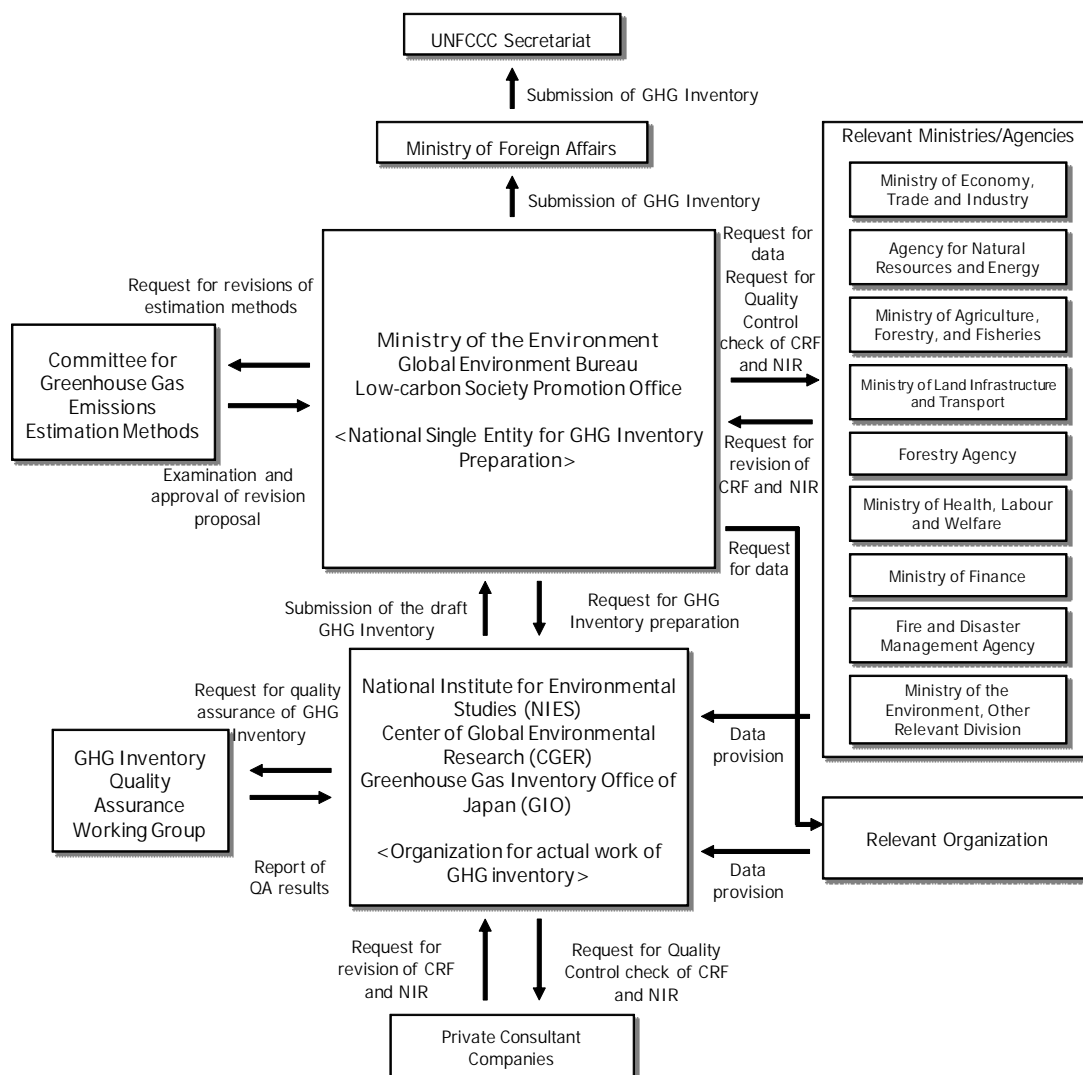

Figure 1-22 Japan's Institutional Arrangements for the National Inventory Preparation

1.2.2. Roles and Responsibilities of Each Entity Involved in the Inventory Preparation Process

The following are the agencies involved in the inventory compilation process, and the roles of those agencies.

1) Ministry of the Environment (Low-carbon Society Promotion Office, Global Environment Bureau)

- The single national agency responsible for preparing Japan's inventory, which was designated pursuant to the Article 5.1 of Kyoto Protocol.
- It is responsible for editing and submitting the inventory.

2) Greenhouse Gas Inventory Office of Japan (GIO), Center for Global Environmental Research, National Institute for Environmental Studies

- Performs the actual work of inventory compilation. Responsible for inventory calculations, editing, and the archiving and management of all data.

3) Relevant Ministries/Agencies

The relevant ministries and agencies have the following roles and responsibilities regarding inventory compilation.

- Preparation of activity data, emission factor data, and other data needed for inventory compilation, and submission of the data by the submission deadline.
- QC of the data provided to the Ministry of the Environment and the GIO.
- Confirmation and verification of the inventory (CRF, NIR, spreadsheets, and other information) prepared by the Ministry of the Environment and the GIO.
- When necessary, responding to questions from expert review teams about the statistics controlled by relevant ministries and agencies, or about certain data they have prepared, and preparing comments on draft reviews.
- When necessary, responding to visits by expert review teams.

4) Relevant Organizations

Relevant organizations have the following roles and responsibilities regarding inventory compilation.

- Preparation of activity data, emission factor data, and other data needed for inventory compilation, and submission of the data by the submission deadline.
- When necessary, responding to questions from expert review teams about the statistics controlled by relevant organizations, or about certain data they have prepared, and preparing comments on draft reviews.

5) Committee for the Greenhouse Gas Emissions Estimation Methods

The Committee for the Greenhouse Gas Emissions Estimation Methods (“the Committee”) is a committee created and run by the Ministry of the Environment. Its role is to consider the methods for calculating inventory emissions and removals, and consider the selection of parameters such as activity data and emission factors. Under the Committee, the inventory working group (WG), which examines crosscutting issues, and breakout groups that consider sector-specific problems (Breakout group on Energy and Industrial Processes, Breakout Group on Transport, Breakout Group on F-gas [HFCs, PFCs, SF₆, and NF₃], Breakout Group on Agriculture, Breakout group on Waste, and Breakout Group on LULUCF) are set up. In addition, the Taskforce on NMVOC is set up as an additional sub-group under the Inventory WG, and the Taskforce examines NMVOC emission estimation methodologies. The inventory WG, breakout groups, and taskforce consist of experts in

various fields, and consider suggestions for inventory improvements. Improvement suggestions are considered once more by the Committee before approval.

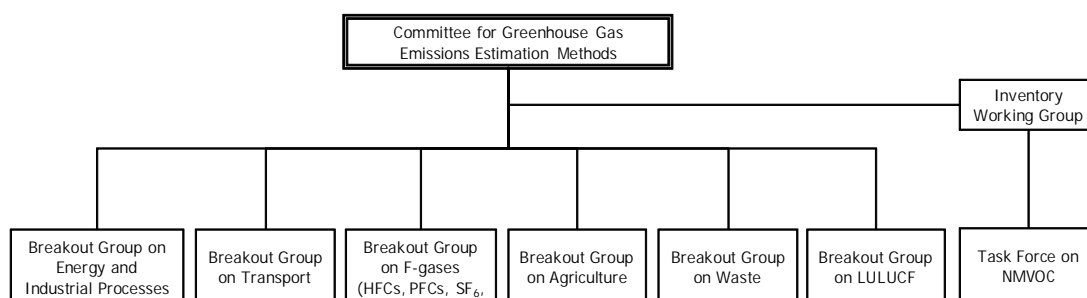

Figure 1-23 Structure of the Committee for the Greenhouse Gas Emissions Estimation Methods

6) Private Consulting Companies

Private consulting companies that are contracted by the Ministry of the Environment to perform tasks related to inventory compilation play the following roles in inventory compilation based on their contracts.

- QC of inventory (CRF, NIR, spreadsheets, and other information) compiled by the Ministry of the Environment and the GIO.
- When necessary, providing support for responding to questions from expert review teams and for preparing comments on draft reviews.
- When necessary, providing support for responding to visits by expert review teams.

7) GHG Inventory Quality Assurance Working Group (Expert Peer Review) (QAWG)

The GHG Inventory Quality Assurance Working Group (the QAWG) is an organization that is established for QA activities, and is composed of experts who are not directly involved in inventory compilation. Its role is to assure inventory quality and to identify places that need improvement by conducting detailed reviews of each emission source and sink in the inventory.

1.2.3. Brief Description of the Inventory Preparation Process

1.2.3.1. Annual Inventory Preparation Cycle

Table 1-16 shows the annual inventory preparation cycle. In Japan, in advance of the estimation of the national inventory to be submitted to the UNFCCC (submission deadline: April 15), preliminary figures are estimated and published as a document for an official announcement. (In preliminary figures, only GHG emissions excluding removals are estimated.)

Table 1-16 Annual Inventory Preparation Cycle

		*Inventory preparation in fiscal year "n"											
Process	Relevant Entities	Calendar Year n+1								CY n+2			
		Fiscal Year n+1								FY n+2			FY n+2
		May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar	Apr
1	Discussion on the inventory improvement	MOE, GIO											
2	Holding the meeting of the Committee	MOE, (GIO, Private consultant)											
3	Collection of data for the national inventory	MOE, GIO, Relevant Ministries/Agencies, Relevant organization, Private consultant											
4	Preparation of a draft of CRF	GIO, Private consultant											
5	Preparation of a draft of NIR	GIO, Private consultant											
6	Implementation of the external QC and the coordination with the relevant ministries and agencies	MOE, GIO, Relevant Ministries/Agencies, Private consultant											
7	Correction of the drafts of CRF and NIR	MOE, GIO, Private consultant											
8	Submission and official announcement of the national inventory	MOE, Ministry of Foreign Affairs, GIO											
9	Holding the meeting of the QA-WG	MOE, GIO											

() Inventory submission and official announcement must be implemented within 6 weeks after April 15.

1.2.3.2. Inventory Preparation Process

1) Discussion on inventory improvement (Step 1)

The MOE and the GIO identify the items, that need to be addressed by the Committee, based on the results of the previous inventory review by the UNFCCC, the recommendations of the Inventory Quality Assurance Working Group (QAWG), and the items needing improvement as identified at former Committee meetings, as well as any other items requiring revision as determined during previous inventory preparations. The schedule for the expert evaluation (Step 2) is developed by taking the above-mentioned information into account.

2) Holding the meeting of the Committee for the Greenhouse Gas Emission Estimation Methods (evaluation and examination of estimation methods by experts) (Step 2)

The MOE holds a meeting of the Committee, in which estimation methodologies for the annual inventory and the issues that require technical review are discussed by experts with different scientific backgrounds.

3) Collection of data for the national inventory (Step 3)

The data required for preparing the national inventory and the supplementary information required under Article 7.1 of the Kyoto Protocol are collected.

4) Preparation of a draft of CRF draft (including the implementation of the key category analysis and the uncertainty assessment) (Step 4)

The data input and estimation of emissions and removals are carried out simultaneously by utilizing files containing spreadsheets (JNGI: Japan's National GHG Inventory files), which have inter-connecting links among themselves based on the calculation formulas for emissions and

removals. Subsequently, the key category analysis and the uncertainty assessment are also carried out.

5) Preparation of the draft of NIR (Step 5)

The draft of the NIR is prepared by following the general guidelines made by the MOE and the GIO. The MOE and the GIO identify the points that need to be revised or require an additional description by taking the discussion at Step 1 into account. The GIO and the selected private consulting companies prepare the new NIR by updating the data, and by adding to and revising descriptions used in the previous NIR.

6) Implementation of the external QC and coordination with relevant ministries and agencies (Step 6)

As a QC activity, the selected private consulting companies check the JNGI files and the initial draft CRF (the 0th draft) prepared by the GIO (external QC). The companies not only check the input data and the calculation formulas in the files, but also verify the estimations by re-calculating the total amounts of GHG emissions determined by utilizing the same files. Because of this cross-check, any possible data input and emission estimation mistakes are avoided. They also check the content and descriptions of the initial draft of NIR (the 0th draft) prepared by the GIO. JNGI files, the draft CRF, and the draft NIR, which have been checked by the private consulting companies, are regarded as the primary drafts of the inventories.

Subsequently, the GIO sends out the primary drafts of the inventories and official announcements as electronic computer files to the MOE and the relevant ministries and agencies, and asks them to check the contents of the primary drafts. The data that are estimated based on confidential data are only sent out for confirmation to the ministry and/or agency that provided these confidential data.

7) Correction of the drafts CRF and NIR (Step 7)

When revisions are requested as a result of the check of the primary drafts of the inventories and official announcements by the relevant ministries and agencies (Step 6), the MOE, GIO, and the relevant ministries and/or agencies that submit requests for revisions coordinate the contents of the revisions and then revise the primary drafts and prepare the secondary drafts. The secondary drafts are sent out again to the relevant ministries and/or agencies for conclusive confirmation. If there are no additional requests for revisions, the secondary drafts are considered to be the final versions.

8) Submission and official announcement of the national inventory (Step 8)

The MOE submits the completed inventory to the Ministry of Foreign Affairs, and the Ministry of Foreign Affairs submits the inventory to the UNFCCC Secretariat. At the same time as the submission, information on the estimated GHG emissions and removals are officially announced and published on the MOE's homepage (<http://www.env.go.jp/>) with additional relevant information. The inventory is

also published on the GIO's homepage (<http://www-gio.nies.go.jp/index-j.html>).

9) Holding the meeting of the Greenhouse Gas Inventory Quality Assurance Working Group (Step 9)

The QAWG, which is composed of experts who are not directly involved in or related to the inventory preparation process, is organized in order to guarantee the inventory's quality and to discover possible improvements.

The QAWG reviews the appropriateness of the estimation methodologies, activity data, emission factors, and the contents of the CRF and NIR. GIO integrates the items identified for improvement by the QAWG into the inventory improvement plan, and utilizes them in discussions on the inventory estimation methods and in subsequent inventory preparation.

1.2.4. Information on the QA/QC Plan

The QA/QC Plan is an internal document that documents the contents of QA/QC activities in all processes from the start of the National Inventory Report compilation to the final reporting, preparation schedule, and role distribution of each involved entity. It organizes and systematizes the QA/QC activities in the inventory preparation and clarifies what each entity involved in inventory preparation is supposed to do. Additionally, it is prepared for the purpose of guaranteeing the implementation of QA/QC activities.

The QA/QC Plan clearly states the roles and responsibilities of each entity in the inventory preparation process and defines each inventory preparation process. The relevant entities are MOE, GIO, relevant ministries, relevant agencies, relevant organizations, the Committee, selected private consulting companies, and the QAWG. The QC activities (e.g., checking estimation accuracy, archiving documents) are carried out in each step of the inventory preparation process in accordance with the *GPG (2000)* and the *GPG-LULUCF* in order to control the inventory's quality based on the QA/QC Plan. As a QA activity, the QA/QC Plan prescribes implementing a detailed review of each source or sink, to be conducted by experts who are not directly involved in or related to the inventory preparation process (QA activities by QAWG).

1.3. National Registry

This table describes the national registry that provides supplementary information as stated in Article 7.2 of the Kyoto Protocol. The following information is based on Decision 13/CP.10 ANNEX II para 1¹².

Item	Content
(a) The name and contact information of the registry administrator designated by the Party to maintain the national registry	<p>[Contact information]</p> <ul style="list-style-type: none"> • Mr. Kazuyoshi Hasunuma, Global Environment Partnership and Technologies Office, Industrial Science and Technology Policy and Environment Bureau, Ministry of Economy, Trade and Industry (TEL: +81-3-3501-1757, E-mail: kyomecha-tourokubo@meti.go.jp) • Mr. Yuji Mizuno, Market Mechanism Office, Global Environment Bureau, Ministry of the Environment (TEL: +81-3-5521-8354, E-mail: kyomecha-registry@env.go.jp)
(b) The names of other Parties with which the Party cooperates by maintaining their national registries in a consolidated system	None relevant
(c) Description of the database structure and capacity of the national registry	<p>[Database structure] A server equipped with disk array storage from Sun Microsystems, Inc. is used as the database server. Disk array storage is a mirroring framework that allows for replacing a failed hard disk without stopping operations. The software of the database server is implemented using an Oracle relational database management system.</p> <p>[Capacity] The database server possesses sufficient data capacity based on forecasted workload during the first and second commitment periods. In the event of an increase in the necessary capacity, additional hard disks could be attached to the database server.</p>
(d) A description of how the national registry conforms to technical standards for data exchange between registry systems for the purpose of ensuring the accurate, highly transparent, and efficient exchange of data between national registries, the CDM registry, and the transaction log	<ul style="list-style-type: none"> • In 2006, certain Data Exchange Standards (DES) prepared by the UNFCCC Secretariat were updated four times (versions 1.1a, 1.1b, 1.1c, and 1.1 Final). The national registry was revamped to comply with the new version, including correcting response codes and the WSDL. • In October 2007, DES annex E (list of checks to be undertaken by the ITL, version 1.1.001) was released, and the internal checks for the national registry were changed in order to be consistent with the updated Annex E • In August 2008, part of the DES was updated as new checks were added relating to the commitment period reserve associated with the “joint achievement,” which is defined in Article 4 of the Kyoto Protocol. DES Annex E (version 1.1.2) was released and the internal checks of the national registry were updated in order to be consistent with the updated DES. • In March 2009, version 1.4 of the technical specifications for the standard electronic format (SEF) was released. A function was therefore added to output XML files containing information on unit holdings and transactions undertaken, which allows the registry administrators to generate the SEF. • In May 2010, part of the DES was updated as a transaction message flow was changed. DES (version 1.1.6) was released and the new transaction message flow was implemented in the registry in order to be consistent with the updated DES.

¹² FCCC/CP/2004/10/Add.2, p.p.15-16

Item	Content
<p>(e) A description of the procedures employed in the national registry to minimize discrepancies in the issuance, transfer, acquisition, cancellation, and retirement of ERUs, CERs, tCERs, ICERs, AAUs and/or RMUs, as well as in the supplementing of tCERs and ICERs. In addition, the procedure taken to forcefully terminate transactions when a discrepancy is notified and to correct problems in the event of a failure to terminate the transactions.</p>	<p>[Means to minimize discrepancies] The following are some of the checks implemented in the registry to minimize discrepancies.</p> <ol style="list-style-type: none"> (1) Data type validity for information input manually (e.g., numbers, alphanumeric characters) (2) Data value validity for complying with Kyoto unit types. (e.g., whether an expiry date is set for tCERs). (3) The existence validity of corresponding Kyoto units in transferring accounts at the time of transaction. <p>[Procedures for forced termination of discrepant transactions] Transactions are automatically terminated when discrepancies regarding them have been identified.</p> <p>[Procedure in the event of a failure to terminate discrepant transactions] The registry logs information on failed transactions for which discrepancies were identified and forced terminations subsequently failed. The system administrator periodically checks the archive logs to resolve problems. In addition, in the event that there was a failure to terminate a discrepant transaction, the monitoring system automatically detects the failure and notifies the system administrator of it via email.</p>
<p>(f) An overview of security measures employed to prevent unauthorized tampering, and operator errors, and to update methods oversight</p>	<ul style="list-style-type: none"> • VPN communication and SSL encryption were selected for use in accordance with the DES (Version 1.0). • Fingerprint authentication was introduced to limit users that can operate the terminals of the registry administrators, and access was restricted by providing the registry administrators with a private connection. • The information security of the current national registry was audited by a corporation that had acquired BS7799/ISMS certification, which is an international standard for security management. • The servers of the national registry system are established in an Internet data center (IDC) with a 24-hour surveillance system. • All PCs and servers used for the national registry have virus detection software installed and virus pattern files are automatically updated on a regular basis.
<p>(g) A list of information publically assessable through the user interface of the national registry</p>	<ul style="list-style-type: none"> • Account information and a list of authorized legal entities (up-to-date information and by account type). • Total amount of Kyoto units held and issued for each calendar year (by unit type, by account type). • Total amount of Kyoto units held for each calendar year at the beginning and end of each year (by unit type, by account type). • Total amount of Kyoto units subject to external transfers for each calendar year (by unit type, by partner party). • Total amount of expired, cancelled, and replaced Kyoto units for each calendar year (by unit type, by transaction type). • Summary information on transactions undertaken for each calendar year (by unit type). • Information on corrected transactions (by unit type).
<p>(h) The Internet address of the national registry's interface</p>	<p>http://www.registry.go.jp/index_e.html</p>

Item	Content
(i) A description of measures taken to safeguard, maintain, and recover data in order to ensure that data storage is preserved and registry services are recovered in the event of a disaster	<p>[Data protection] The national registry is established at an Internet data center (IDC) with the following characteristics.</p> <ul style="list-style-type: none"> • An anti-seismic building with high aseismic capacity. • Electrical facilities that guarantee over 24 hours of continuous operation in the event of a power failure. • Fire-resistant construction possessing a gas-type fire extinguishing system. <p>[Data management] Online backup as well as redundant configuration of duplicates is implemented.</p> <p>[Data recovery] Separate system recovery manuals have been created for both hardware and software failure. In addition, disaster recovery exercises are conducted regularly and procedures are checked in order to recover the system promptly and infallibly in the event of a failure.</p>
(j) The results of tests developed for testing the performance, procedures, and security measures of the national registry conducted in accordance with the provisions of Decision 19/CP.7 relating to technical standards for data exchange between registry systems	<p>In July 2007, a test was conducted between the ITL and the national registry of Japan based on DES annex H Version 1.1.002. The test was a success as the anticipated results were achieved in each of the test areas.</p> <p>In addition, the following tests were conducted between the ITL and the national registry before and after the go-live.</p> <p>-Go-live test In November 2007, a test was conducted in preparation for the Japanese registry connecting to the ITL for live operation. The test was completed without any problems and the live operation commenced.</p> <p>-ETS go-live test In October 2008, a test was conducted in accordance with the CITL and national registries of the EU connecting to the ITL for live operation. The test was completed without any problems.</p> <p>-SEF coordinated testing In December 2008, predefined test transactions were conducted in a test environment. SEF results were output by the national registry of Japan and consistency was confirmed between the SEF generated by the registry and one generated by the ITL.</p> <p>-Annex H testing for CP2 In September 2012, Annex H testing for CP2 was added in DES (version 1.1.9). In November 2012, the interoperability test for CP2 was conducted between the national registry of Japan and the ITL in a test environment.</p> <p>-Developer test Tests using the developer environment and registry environment provided by the UNFCCC are conducted as necessary.</p> <p>Before conducting the tests listed above, internal tests were conducted to check the functionality, operability, performance, security, and reliability of the registry system.</p>

Chapter 2 Quantified economy-wide emission reduction target

Japan's greenhouse gas emission reduction and removal target is a 3.8% emission reduction in 2020 compared to the 2005 level (1,351 million t-CO₂ equivalent).

This is a target at this point, which has not yet taken into account the emission reduction effect resulting from nuclear power, given that the energy policy and energy mix, including the utilization of nuclear power, are still under consideration. A firm target, based on further review of the energy policy and energy mix will eventually be set.

The target for the LULUCF sector is to ensure that the amount of removals by forest management for the period between FY2013 and FY2020 will be, on average, 3.5% of the total GHG emissions in FY1990 (approximately 44 million t-CO₂), which is the agreed upper limit of removals by forest management for the second commitment period of the Kyoto Protocol. To this end, the government envisages to continually implement necessary policies and measures. Based on certain assumptions, for the year FY2020, the level of removals will correspond with approximately 2.8% or more of the total GHG emissions in FY2005 (approximately 38 million t-CO₂).

Japan is promoting the establishment and implementation of the "Joint Crediting Mechanism (JCM)" in which Japan facilitates the diffusion of advanced low carbon technologies, products, systems, services, and infrastructure as well as implementation of mitigation actions, and contributes to sustainable development of developing countries. Following an appropriate evaluation of the contributions to GHG emission reductions or removals in developing countries in a quantitative manner, Japan will use them to achieve its emission reduction target.

[Base year]

Base year	FY2005
Emission reduction target	-3.8% of base year
Period for reaching target	FY2020

[Gases, sectors covered and GWP]

Gases covered	Base year for each gas	GWP values
CO ₂	FY2005	IPCC Second Assessment Report (SAR)
CH ₄	FY2005	IPCC Second Assessment Report (SAR)
N ₂ O	FY2005	IPCC Second Assessment Report (SAR)
HFCs	CY2005	IPCC Second Assessment Report (SAR)
PFCs	CY2005	IPCC Second Assessment Report (SAR)
SF ₆	CY2005	IPCC Second Assessment Report (SAR)
NF ₃	CY2005	IPCC Fourth Assessment Report (AR4)

Sector covered	Energy Transport Industrial Processes Agriculture LULUCF Waste
----------------	---

[Approach to counting emissions and removals from the LULUCF sector]

LULUCF in base year level and target	Included	The target for the LULUCF sector is to ensure that the amount of removals by forest management for the period between FY2013 and FY2020 will be, on average, 3.5% of the total GHG emissions in FY1990 (approximately 44 million t-CO ₂), which is the agreed upper limit of removals by forest management for the second commitment period of the Kyoto Protocol. To this end, the government envisages to continually implement necessary policies and measures. Based on certain assumptions, for the year FY2020, the level of removals will correspond with approximately 2.8% or more of the total GHG emissions in FY2005 (approximately 38 million t-CO ₂).
Contribution of LULUCF is calculated using	Activity-based approach	

[Market based mechanisms]

Possible scale of contributions of market based mechanisms under the Convention (Estimated ktCO ₂ eq.)	CERs
	ERUs
	AAUs
	Carry-Over units
	Other mechanism units under the Convention
Possible scale of contributions of other market based mechanisms (Estimated ktCO ₂ eq.)	JCM

[Other information]

Other information	This is a target at this point, which has not yet taken into account the emission reduction effect resulting from nuclear power, given that the energy policy and energy mix, including the utilization of nuclear power, are still under consideration. A firm target, based on further review of the energy policy and energy mix will eventually be set.
-------------------	---

Chapter 3 Progress in achievement of quantified economy-wide emission reduction targets and relevant information

3.1. Mitigation actions and their effects

3.1.1. Information on institutional arrangements in Japan

3.1.1.1. Development of Japan's Promotion System

In the Government, related ministries and agencies will closely cooperate with each other, led by the “Global Warming Prevention Headquarters” chaired by the Prime Minister and all Cabinet ministers as member, and the “Directors’ Meeting of the Global Warming Prevention Headquarters” as a ministries’ director-general level meeting.

For regions, relevant ministries and agencies will work together to back up initiatives to address global warming by local governments by utilizing the “Regional Committees for Promoting Energy and Global Warming Countermeasures” established in each regional block, in cooperation with local governments, Regional Councils on Global Warming Countermeasures, Regional Biomass Councils and so on.

3.1.1.2. Progress Management of Policies and Measures

The Government will strictly manage the progress of policies and measures stated in this chapter.

The Government will strictly assess and verify voluntary initiatives conducted by business operators in accordance with the “Commitment to a Low Carbon Society”. As for measures and policies stated in the Japan Revitalization Strategy endorsed by the Cabinet on June 25, 2013, the Government will implement the conventional PDCA cycle and verify the achievement status of the set performance targets, anything lacking when those targets are not achieved, as well as what issues exist in the current policies and measures, and points to be improved including abolishment of ineffective policies and measures. The Government will estimate the greenhouse gas emission levels biannually (preliminary and definite values) to check the emission trends by sector and by gas.

3.1.2. Policies and Measures on Mitigation Actions and Their Effects

3.1.2.1. Policies and Measures for Greenhouse Gas Emissions Reductions and Removals

3.1.2.1.a. Policies and Measures for Greenhouse Gas Emissions Reductions

a) Energy-originated CO₂

1) Formulation of Low-carbon Urban/Regional Structures and Socioeconomic Systems

Since urban/regional structures and transportation systems will continue to influence CO₂ emissions in the mid- and long-term time frames through increases/decreases in traffic and other factors, the Government will encourage low-carbon urban/regional development in the mid- and long-term time frame by low-carbonizing urban/regional structures and socio-economic system through the promotion of non-fossil-fuel energy use such as solar power, supports for actions on GHG emissions reduction led by citizens and business operators and promotion of rearrangement and improvement of regional environment (i.e. promotion of convenience of public transportation) based on the action plans for low carbon society in the local level which are in accordance with the Act on Promotion of Global Warming Countermeasures (Act No. 117 of 1998) and such activities are expected to be associated with city plans, the Plan on Establishment of Agricultural Promotion Regions, and other countermeasures. At the same time, concerning the cities with high energy demands, activities should be conducted such as improvement of energy use through holistic and efficient use of energy, implementation of countermeasures against urban heat island, and formulation of Compact Cities by concentrating urban functions. Moreover, such activities should be in accordance with local low-carbon city plans based on the Low Carbon City Act (Act No. 84 of 2012) and be consistent with action plans for low carbon society and master plans for city planning in the local level.

2) Policies and Measures by Sector (Industrial, Residential & Commercial, Transport, etc.)

A. Initiatives in the Industrial Sector (Manufacturers, etc.)

(a) Promotion and Reinforcement of Voluntary Action Plans of Industry (voluntary initiatives by business operators in accordance with the Commitment to a Low Carbon Society)

Through the formulation and publication of the Guidelines for Controlling Greenhouse Gas Emissions based on the Act on Promotion of Global Warming Countermeasures, the Government will encourage business operators to actively implement environmentally-friendly business actions on a voluntary basis.

Although the Guidelines for Controlling Greenhouse Gas Emissions have been formulated in some sectors, the guidelines will be reviewed as necessary in reference to the development of

available cutting-edge technologies (best available technologies: BATs).

The industrial community has made certain achievements to reduce emissions in the industry, commercial, transport and energy conversion sectors by voluntarily developing and implementing greenhouse gas emissions reduction plans (Voluntary Action Plans). As initiatives after FY2013, each industry group formulates and implements greenhouse gas emission reduction plans (the Commitment to a Low Carbon Society) with the pillars of ‘2020 targets for global warming countermeasures of domestic business activities,’ with the assumption of the maximum use of the world’s most advanced low-carbon technologies, ‘contribution to emissions reduction in the other sector through providing low-carbon products and services,’ ‘promoting international contributions (contributions to emissions reduction in the other countries),’ and ‘developing and introducing innovative technologies’ in order to pursue voluntary initiatives by business operators. The formulation and progress statuses of those initiatives will continue to be strictly assessed and verified by the Government.

(b) Promotion of Introduction of Highly Energy-efficient Equipment and Devices

Encouraging business operators to invest in energy saving, the Government will implement support measures including replacement with cutting-edge energy-saving equipment at the time of replacing facilities and equipment at plants and operation sites. Approximately 90 percent (energy consumption basis) of business operators of the industrial sector are subject to Act on the Rational Use of Energy (Act No. 49 of 1979) and the Government will provide guidance etc. to those who have problems with improving energy intensity and complying with judgment criteria, based on periodical reports etc.

In addition to the manufacturing industry, the Government will work on the diffusion of fuel-efficient and low-carbon construction machinery in the construction industry and support for the implementation of and R&D for global warming countermeasures in the agriculture, forestry and fishing industries.

B. Initiatives in the Commercial and Other Sector

(a) Low-carbonization and Energy-savings in Equipment and Devices

The Government improves energy-saving performance of devices through application of the Top Runner Program that requires manufacturers and importers of products to meet criteria which is in line with standards of currently most-advanced devices and assumed technological advances in about 3 to 10 years. The Government is expanding the application of the Top Runner Program onto equipment and devices such as electric water heaters (heat pump water heaters), multifunction machinery and printers, and LED light bulbs were newly added in 2013.

Through the formulation and publication of the Guidelines for Controlling Greenhouse Gas Emissions Based on the Act on Promotion of Global Warming Countermeasures, the

Government will encourage business operators to implement energy-saving and low-carbonization business actions on their equipment.

(b) Improvement of the Energy-efficiency Performance and Low-carbonization of Housing and Buildings

While giving full consideration to the necessity and levels of regulations and their balance, and other matters, the Government will make it mandatory in stages to comply with energy conservation standards for newly constructed housing and buildings by 2020. The Government will develop an environment for smooth implementation of steps toward this end while giving full consideration to improving the construction techniques of small- and medium-sized builders and carpenters and the positioning of traditional wooden houses. Specifically, the Government will further diffuse energy-saving measures and provide support in the development of new technologies and services as well as construction methods that contribute to better energy conservation in housing, building materials, devices and so on. In addition, the Government introduced the Top Runner Program for construction materials, and thermal insulation material was added. Furthermore, the Government will also promote diffusion of low carbon building with a higher energy-efficiency performance. The Government will enhance and diffuse an objective and clarified system for verifying and labeling comprehensive environmental performances of housing and buildings, which includes energy conservative performances, Non-Energy Benefit (NEB) standards including in-room environment and the level of CO₂ emission at each stage of life cycle.

Through promoting the concept of ‘Net Zero Energy’ for housing and buildings with increasing energy consumption, the Government will aim to realize the concept for the average energy consumption of new housing and buildings by 2030.

Furthermore, the Government will pursue supports such as retrofits to improve energy-efficiency and low carbonization, improvement of the use of equipment and devices, provision of consultation on potential capacity of GHG emissions reduction, promoted use of data of energy consumption and so on in order to improve the energy-saving performance of the entire stock (existing housing and buildings). Also the Government will discuss multilateral measures which are expected to be in need in the future specifically for replacing equipment with high-performed one.

(c) Smart Consumption of Energy by Using Energy Management

The Government will improve the method for using devices by dramatically enhancing the energy consumption efficiency of equipment and utilize the developed network, while realizing the smart consumption of energy through ‘Energy management’ through which consumers voluntarily participate in and contribute to the demand and supply as well as management of energy with a view to create a society with optimum, efficient energy consumption.

Specifically, the Government will promote the setting and expansion of diverse electricity bill menus through conducting operation tests of demand response system in four smart community regions and the Electricity System Reform. In addition, the Government will promote the introduction of smart meters as infrastructure and install them in all households and plants in the early 2020s. At the same time, the Government will promote the introduction of the energy management systems such as HEMS (Home Energy Management System) and BEMS (Building Energy Management System), develop an environment where the entire Japan consumes energy in a smart manner, and promote actions utilizing energy consumption data with the aim of optimizing energy consumption.

For the infrastructure used in the operations of water supply, sewage system and waste management, the use of renewable energy and energy-saving will be promoted to curb GHG emissions from the commercial sector.

The Government will engage in the diffusion and commercialization of services using the green ICT which is expected to lead to cleaner and more economically-efficient society. The policy is including the development of new Green Data Centre and aiming at curbing CO₂ emissions through the use of green ICT.

(d) Initiatives by Public Organizations

The Government will reduce greenhouse gas emissions with regard to its own administration and undertakings at a level which is equivalent or superior to initiatives in the current national commitment plan, even during the period before the new national commitment plan is formulated in line with the new plan for global warming prevention.

The Government will conclude “contracts considering reduction of greenhouse gases and other emissions” mainly in six areas (namely, supply of electricity, automobiles, vessels, ESCO, buildings, and industrial waste) based on the “Law Concerning the Promotion of Contracts Considering Reduction of Emissions of Greenhouse Gases and Other Emissions by the State and Other Entities (Act No. 56 of 2007)”, as well as its basic policy.

In order to spur demands for products that contribute to greenhouse gas emissions reduction and other eco-friendly goods and services, the Government will take the initiative in procuring such goods and services based on the “Law Concerning the Promotion of Procurement of Eco-Friendly Goods and Services by the State and Other Entities (Act No. 100 of 2000; hereinafter referred to as the “Green Purchasing Law”)”. Prefectures and municipalities will take actions such as implementing countermeasures with regards to the natural and social conditions of region and reducing GHG emissions from their administrative operations.

C. Initiatives in the Residential Sector

(a) Low-carbonization and Energy-savings in Equipment and Devices (Reprinted)

(b) Improvement of the Energy-efficiency Performance and Low-carbonization of Housing

and Buildings (Reprinted)

(c) Diffusion of Combined Heat and Power

Since simultaneous generation and use of electricity and heat enables effective consumption of energy, the Government promotes the diffusion of combined heat and power such as household fuel cells (“Ene-farm”). In order to accelerate the introduction of fuel cells to Japan’s market ahead of the world, the Government promotes advanced research and development and strive to lower cost while promoting thorough standardization of this technology, with an eye to introducing 5.3 million household fuel cells (“Ene-farm”) into the market by 2030 (1.4 million by 2020).

(d) Other Supportive Measures

The Government will work on the “visualization” of CO₂ emissions by various product types by displaying information on emissions and other items during the product’s life cycle. Moreover, the Government will work to promote innovative changes towards low-carbon lifestyle through the introduction of HEMS, which operates lighting, air conditioners and other devices to optimally adjust to interior conditions, promotion of the use of HEMS data, and promotion of “Home CO₂ advisor service.”

D. Initiatives in the Transport Sector

(a) Promotion of the Use and Diffusion of Vehicles with Lower Environmental Load

For highly energy-efficient next-generation vehicles (including hybrid vehicles, electric vehicles, plug-in hybrid vehicles, fuel-cell vehicles, clean diesel vehicles and compressed natural gas vehicles), the Government will aim to increase the share of these vehicles in the new car sales from 50 percent to 70 percent by 2030 by promoting measures to create initial demand, support R&D to improve performance and build efficient infrastructure.

Specifically, in addition to promoting the development of recharging infrastructure, the Government will support the purchase of EVs to create mass production effects and to promote price reduction and also support research and development to extend a cruising range and reduce cost.

In order to enable the release of fuel-cell vehicles to the market in 2015, the Government will review regulations on fuel-cell vehicles and hydrogen infrastructure and support the introduction of hydrogen stations (preliminary introduction in approximately 100 locations mainly in four major metropolitan areas by FY2015) with the aim to achieve the world’s fastest diffusion of fuel-cell vehicles.

In order to promote such diffusion of next-generation automobiles, the Government will work to provide preferential tax treatment such as tax cuts for eco-friendly automobiles.

(b) Promotion of Traffic Flow Management and Promotion of the Environmentally-friendly Usages of Vehicles

The Government will promote the environmentally-conscious form of driving by pursuing the diffusion of Eco-drive Management Systems (EMS) for vehicle transport operators. At the same time, the Government will promote the smoother traffic flows by improving main traffic network using loop roads and multi-level crossovers which are effective to reduce CO₂ emissions, reducing roadworks, introducing to manage the crossings whose gates always seem to be closed, and promotion of the development of traffic safety facilities such as traffic signals. Furthermore, the Government will also rearrange the traffic environment to be safer and more comfortable for bike users improve the administration of pricing on highway use, and promote the introduction of Intelligent Transport System (ITS) which is effective for drivers to select the best routes to their destinations.

Also for general roads, the Government will engage in traffic flow management such as reduction of traffic congestions by applying ITS.

(c) Promotion of Public Transport Utilization

The Government will promote the use of public transport systems through various measures including improving the service and convenience of railways and buses (facilitating connections, diffusing IC travel card, making vehicles and passenger terminal facilities barrier-free, developing public transport systems such as new line of railway, Light Rail Transit (LRT) and Bus Rapid Transit (BRT) etc.), and promotion of eco-commuting.

(d) Promotion of Low-Carbonized Transportation through Railway, Vessel, and Aviation

The Government will promote the low carbonization of vessels, railways and aircraft including energy saving in domestic vessels through manufacturing of Super Eco-Ships, alternation to the manufacturing of vessels with energy-saving equipment, energy saving in domestic aviation through efficient operating method for aircrafts and low-carbonization of airport facilities, and energy saving in railways by advancing the Eco-Rail Line project, which introduces highly energy-efficient vehicles and renewable energies in railway facilities etc.

(e) Improvement of the Efficiency of Logistics Systems and Promotion of Modal Shifts, etc.

The Government will improve the efficiency of truck transport by encouraging the use of larger trucks such as large CNG trucks and promoting cooperative transport and delivery by logistics operators etc. within regions.

In addition, the Government will promote modal shifts from truck transport such as a shift to rail

freight through installation of large containers (31 ft), which is efficient to promote phasing out from larger trucks use, and the “Eco- Rail Mark” etc., a shift to coastal shipping through introduction of truck with separable trailers and the “Eco-Ship Mark”, reduction of the total distance of land transportation of international cargo through the rearrangement of freight terminals etc. for international vessel transportation, and so on. Furthermore, the Government will aim at further reduction of environmental load by strengthening a partnership between owners of goods and operators of logistics.

The Government will also promote low energy conservation of harbor areas, and facilitation of renewable energy introduction and its use at the harbors which are the node of vessel transportation and land transportation.

In addition, concerning biofuel, the Government will promote the research and development of technologies aimed at practical use.

E. Initiatives in the Energy Conversion Sector

(a) Power from Renewable Energy Sources

Carbon dioxide emission levels from renewable energy are smaller compared to thermal power. Thus, promoting further introduction of renewable energies is vital for conducting measures in the energy conversion sector.

In addition to the viewpoint of improving energy security through the use of domestic energy resources, promoting renewable energy also represents an important growth strategy, since it stimulates creation of a new energy-related industry and expansion of job opportunities, which supports the national developing strategy. The Government will promote the thorough use of renewable energy sources including onshore and offshore wind power, solar power, small-scale hydro power, geothermal power and biomass and expand their introduction to the maximum extent possible for the coming three years.

As the first step, the Government will enhance the steady and stable operation of feed-in tariff scheme, implement rearrangement and operation tests of the power grid, streamline the procedure of environmental impact assessment (usually procedures take three to four years, hence, reduce the period by half), implement other regulatory and institutional reform such as rationalization of safety regulations etc. to stimulate investment of private finance.

In terms of wind power generation, the Government will promote its introduction by urgent introduction of large storage batteries for the power system, creating a condition for early strengthening of Hokkaido-Honshu Electric Power Interconnection Facility, rearrangement and operation tests for the power grid, and regulatory and institutional reform including streamlining the procedure of environmental impact assessment and rationalization of safety regulation. In particular, for offshore floating wind power generation, the Government aims to overcome its technical challenges, establish evaluation methods for safety, reliability and economic aspect and

environmental assessment method through demonstration projects by 2015. At the same time, the government will achieve commercialization by around 2018 while promoting establishment of international standards.

Concerning solar power generation, the Government will promote the introduction within the country through feed-in tariff scheme and regulatory and institutional reform, and aim for its diffusion by reducing power generation costs through development and implementation of innovative technologies.

For the promotion of geothermal power generation, the Government will enhance the introduction by regulatory and institutional reform including streamlining the procedure of environmental impact assessment and rationalization of safety regulations to enhance the use of small-scale geothermal power generation using the existing wells at hot springs, promoting understanding of people in the local level, and research projects on potential feasibility of geothermal power.

For the promotion of small-scale hydro power generation, the Government will continue to arrange business environment which promotes the introduction.

For biomass energy, the Government will focus on the promotion of industrialization and introduction of biomass energy by establishing the framework to promote actions aiming at developing the primary sector with using the renewable energy, will promote the use of urban biomass use such as sewage sludge, and aim at achieving the use of local biomass energy in 100 regions in 5 years.

Other than the abovementioned energy sources, the Government will take actions for early commercialization of ocean power generation through technology development and demonstration.

In addition to these activities, the Government will, among others, promote the demonstration and introduction of the independent and decentralized energy system with renewable energies as a core, in regions such as remote islands.

(b) Renewable Heat Energy

The Government will promote the use of renewable heat energy sources that are specific to particular regions, such as solar heat, biomass heat, geo-heat, hot springs heat, river heat, sewage heat and ice melt heat, and also the use of exhaust heat such as waste heat from incineration, in order to realize efficient energy supply in local regions.

(c) Persuasion of High Efficiency in Thermal Power Generation

The government will advance introduction of highly efficient thermal power generation (coal/LNG) with environmental considerations, and make efforts to improve power generation efficiency further by advancing technology development.

Specifically, the Government will promote development of framework for managing CO₂

emissions trend with participation of the whole stakeholders of power generation, which should be consistent with the national GHG emissions reduction target based on the review of energy policies and energy mix. Moreover, speeding-up and clarification of environmental assessment should be promoted and the Government will arrange environment for the private sector so that the sector can easily invest in the highly-efficient (coal or LNG) thermal power generation.

At the same time, the Government will support technological development. The Government aims to achieve practical use of advanced ultra-supercritical (A-USC) thermal power generation in 2020s (generating efficiency: around 39% at present to improve to around 46%). The Government aims to establish technology of integrated coal gasification fuel cell combined cycle (IGFC) by 2025 and achieve practical use in 2030s (generating efficiency: around 39% at present to improve to around 55%) For LNG thermal power generation, the Government aims to achieve practical use of gas turbine of 1700 °C class by around 2020 (generating efficiency: around 52% at present to improve to around 57%). Also concerning carbon dioxide capture and storage (CCS), the Government will accelerate technological development for practical use around 2020s and conduct survey on potential CO₂ storage sites for CCS precondition in order to obtain outcomes at an early date. Also the Government will consider the possibility of coal thermal power plants being equipped with CCS by 2030 on the precondition of commercialization, make it clear what to expect on CCS Ready along with a considerations about the progress of survey on the sites and commercialization, and consider the possibility of the introduction of CCS Ready as early as possible.

(d) Utilizing Nuclear Power Generations whose Safety is Confirmed

The Government will leave judgment of the safety of nuclear power plants to the specialist of the Nuclear Regulation Authority. When the Nuclear Regulation Authority admits the compliance to regulatory standards, the government will respect the judgment and will proceed with the restart of the nuclear plant. In this case, the Government will make efforts to obtain understanding and cooperation of relevant parties including the municipality of each nuclear facility site.

b) Non Energy-originated CO₂

The Government will reduce CO₂ emissions in the cement production process by reducing the production volume of clinker through increased production proportion and expanded use of blended cement, which is made by mixing blast-furnace slag with clinker, an intermediate cement product. Specifically, in public works administrated by the government, the use of blended cement will be promoted in accordance with “Green Purchasing Law”.

In addition, the Government will reduce CO₂ emissions from waste incineration by promoting waste reduction and recycling. The Government will promote 3Rs initiatives for achieving the targets set out in the Basic Plan for Establishing a Recycling-Based Society (hereinafter referred to as Basic Recycling Plan), formulated in accordance with the “Basic Act on Establishing a

Sound Material-Cycle Society (Law No. 110, 2000; hereinafter referred to as the Basic Recycling Law)” as well as the waste reduction targets set out in the “Waste Management and Public Cleansing Law (Law No. 137, 1970; hereinafter referred to as Waste Management Law)” in line with the target set in Basic Recycling Law. Specifically, the Government will promote waste reduction and recycling by thorough waste sorting and collection as well as imposition of charges for waste collection by municipal governments, actions complying with individual recycling laws and actions based on the Guidelines for Controlling Greenhouse Gas Emissions. Also, CO₂ emissions should be reduced through reducing the amount of incinerated wastes by promoting the arrangement of waste disposal facilities which contribute to the realization of 3Rs in line with the waste disposal facility development plan based on the Waste Management Law.

c) Methane and Nitrous Oxide

1) Methane (CH₄)

The Government will promote the reduction of direct landfill of organic waste such as garbage, which will in turn reduce methane emissions associated with waste landfill. The Government will also promote the 3Rs initiatives for achieving the targets set out in the Basic Recycling Plan formulated in accordance with the Basic Recycling Law and the waste reduction targets stipulated in the Waste Management Law in line with the targets in the Basic Recycling Law. Specifically, the Government will promote waste reduction and recycling through the following measures: reviews of disposal methods and thorough waste sorting and collection by municipal governments, reducing illegal dumping of industrial wastes through more strict waste disposal systems and the development of model disposal operators; and promoting actions based on the Guidelines for Controlling Greenhouse Gas Emissions. At the same time, the Government will reduce the amount of direct landfill of organic waste by promoting the improvement of the systems for waste disposal facilities of municipalities, including through banning the direct disposal to landfill of organic wastes in principle, in accordance with the waste disposal facility development plan based on the Waste Management Law.

Moreover, methane emissions associated with rice cultivation can be reduced by changing the way organic matter is managed in line with local conditions, including replacing the conventional approach of plowing in rice straw with application of compost.

2) Nitrous Oxide (N₂O)

Upgrading combustion technology at sewage sludge incineration facilities will help to reduce nitrous oxide emissions associated with combustion. To this end, the Government has standardized the level of sophistication of combusting sewage sludge at sewage treatment facilities, and the Government will ensure the implementation of this, in addition to developing and diffusing sewage sludge combustion technology which emits lower nitrous oxide than ever

before.

The Government will reduce nitrous oxide emissions associated with the waste incineration by promoting the upgrade of combustion technology at general waste incineration facilities such as implementing consecutive operation of consecutive incinerator. Moreover, the Government will reduce nitrous oxide emissions by promoting the 3Rs initiatives for achieving the targets set out in the Basic Recycling Plan formulated in accordance with the Basic Recycling Law and the waste reduction targets stipulated in the Waste Management Law in line with the targets in the Basic Recycling Law, and by promoting the arrangement of waste disposal facilities which contribute to the realization of 3Rs in line with the waste disposal facilities development plan based on the Waste Management Law.

The Government will aim at the emissions reduction of nitrous oxide associated with the application of fertilizers through the use of lower fertilizer application rates, split-application regimes and slow-release fertilizers.

d) Fluorinated Gases: HFC, PFC, SF₆ and NF₃

Phasing out of ozone-depleting HCFC refrigerants in equipment such as air conditioners and shifting to HFC as an alternative have caused an increase in HFC emissions, and this is expected to grow further in the future. Legislations such as the Law for Ensuring the Implementation, “Law concerning the Recovery and Destruction of Fluorocarbons (Act No. 64 of 2001; hereinafter referred to as Fluorocarbons Recovery and Destruction Law)”, “Act on Recycling of Specified Kinds of Home Appliances (Act No. 97 of 1998)” and “Act on Recycling, etc. of End-of-Life Vehicles (Act No. 87 of 2002)” require that HFC refrigerants, like CFCs and HCFCs, be properly collected at a time of disposing equipment. However, in addition to the HFC discharged at the time of equipment disposal, HFCs leaked during the normal operation of equipment and discharged due to the breakdown of equipment are in issue. Because of this situation, the Fluorocarbons Recovery and Destruction Law was amended in June 2013 to take measures to encourage more rational use and more proper management of fluorocarbons among operators at all stages of the fluorocarbon life cycle. The title of the Law was also changed to “Act on Rational Use and Proper Management of Fluorocarbons (hereinafter referred to as Fluorocarbons Law)”.

It is important to ensure the appropriate management and disposal of the four main fluorinated gases; HFC, PFC, SF₆ and NF₃ (NF₃ is a new addition in 2013 under the Kyoto Protocol), which are used as refrigerants for refrigeration and air conditioning equipment. At the same time, it is also important to pursue development and diffusion of other substitutes that have a low global warming potential (GWP) and/or are fluorocarbon-free. Given that it will take some time to achieve the conversion of refrigerants in existing refrigeration and air conditioning equipment on the market, it is important to pursue a rapid implementation of measures through the appropriate application of the Fluorocarbons Law. The Government will promote practical efforts on phasing down of fluorocarbons by gas suppliers, eliminating fluorocarbons and lowering GWP of products by manufacturers, preventing leakage of fluorocarbons from refrigeration and air conditioning

equipment for business use during normal operation period (refrigerant management by end-users), and enhancing and strengthening regulations on recycling and destruction programs designed to check proper disposal and prevent refrigerant discharge.

3.1.2.1.b. Greenhouse Gas Sink Policies and Measures

a) Measures for Managing Forest Carbon Sink

Through implementation of measures designed to achieve the objectives regarding the multiple roles of forests as well as the supply and usage of forest products outlined in the “Basic Plan for Forest and Forestry endorsed by the Cabinet in July 2011 in accordance with the Forest and Forestry Basic Act (Law No. 161, 1964)”, the Government will aim to attain the forest sink target that the amount of removals by forest management for the period between FY2013 and FY2020 will be, on average, 3.5% of the total GHG emissions in FY1990 (approximately 44 million t-CO₂), which is the agreed upper limit of removals by forest management for the second commitment period of the Kyoto Protocol. The level of removals will correspond with approximately 2.8% or more of the total GHG emissions in FY2005 (approximately 38 million t-CO₂).

In order to attain this target, the Government will, with gaining understanding by and cooperation from local governments, various stakeholders and the general public, carry out a variety of measures including thinning an annual average of 520 thousand hectares, appropriate forest development such as planting, proper management and conservation of protection forests, use of timber and woody biomass and so on. In order to fully secure contribution by forest sink in the future to meeting the target of 80% reduction of greenhouse gas emissions by 2050, the Government will promote establishment of seed orchards and scion gardens which are necessary to replace existing breeds of major forestry species with seeds and seedlings that grow well and development of appropriate forest resources through steady planting and other measures.

In addition, the Government will consider new schemes to secure financial resources for forest carbon sink management, including a fiscal policy and levying the cost of forest development on the public. The Government will also promote the public-private joint initiatives in a steady and comprehensive manner, including community afforestation programs and forest environment campaigns designed to gain the extensive understanding and support of the public.

b) Measurement for Sink Source in Agricultural Soil

It is proven that the carbon storage in Japanese agricultural lands and pasture soils can be increased by continuous usage of organic matter in fertilizers and green manures. By promoting these methods, it contributes to the increased carbon storage in both agricultural lands and pasture soils.

c) Promotion of Urban Greening

For the urban greening, actions will be continuously promoted such as park maintenance, greening

in roads and bays, and creation of the new greening spaces at buildings. Improvement in report and verification system for the urban greening will also be strategically carried out.

3.1.2.2. Cross-sectional Strategies

a) GHG Emissions Accounting, Reporting and Disclosure Program

Based on the “Act on Promotion of Global Warming Countermeasures”, Greenhouse gas emitters who exceed the given threshold volume are obligated to measure and report their emission volumes annually to the Government, and the Government firmly administrates the monitoring and reporting system by collecting and sorting out the reported data and disclose it to the public and the Government will further enhance and strengthen this system.

b) Making the Tax System Greener

The Government will pursue greening of the entire tax system including energy and vehicle taxes. The Government will utilize the tax revenue of “Tax for Climate Change Mitigation”, designed to add an extra tax multiplier commensurate with CO₂ emission levels from the all fossil fuel combustion and will firmly implement the various policies to curb energy-originated CO₂ emissions. Additionally, the Government will also strengthen greener taxation system on vehicle taxes by ensuring the concept of “Reducing taxes for Goods, Increasing taxes for Bads” according to the environmental impact.

c) Domestic Emission Trading Scheme

The Government has been considering an emission trading scheme carefully, taking into consideration the burden on domestic industry and associated impacts on employment; ongoing developments of emission trading schemes overseas; evaluation of existing major climate change policy measures such as voluntary actions implemented by the industry sector; and the progress toward the establishment of a fair and effective international framework where all major emitters participate.

d) Preliminary Studies, Forecast and Evaluation of GHG Projects

In order to encourage active efforts by business operators to reduce GHG emissions, the Government will assess environmental impact to ascertain that projects incorporate appropriate environmental conservative considerations during the construction phase and at service delivery.

e) Promotion of Environmental Considerations in Business Activities

Government will encourage business operators to implement environmentally-conscious business activities on a voluntary and active basis by formulating and publishing the Guidelines for Controlling Greenhouse Gas Emissions Based on the Act on Promotion of Global Warming Countermeasures. In addition, the Government will review the guidelines based on the trends of available cutting-edge

technologies in the field. By releasing stakeholder environmental reports in accordance with the Act Concerning the Promotion of Business Activities with Environmental Consideration by Specified Corporation, etc. by Facilitating Access to Environmental Information, and Other Measures (Law No. 77, 2004), the Government will encourage the use of environmental information by stakeholders and by the general public and provide the conditions for business activities with environmental consideration to be highly valued by society and by markets.

f) Greening Finance

The Government will provide financial supports to mobilize private funds into low-carbon projects. More specifically, it will provide equity investment into projects where private financial resources are not sufficient and encourage leasing of low-carbon equipment to reduce the burden of up-front costs. In addition, the Government will promote loans based on environmental responsibility ratings and socially responsible investment (SRI).

g) Promotion of a Credit Scheme for Promoting Emission Reduction Activities in Japan (J-Credit scheme)

In order to actively encourage stakeholders in Japan to reduce GHGs emissions through the introduction of energy-saving equipment, the use of renewable energy and carbon sinks through appropriate forest management, the Government operates the “J-Credit scheme” established in April 2013 as a new credit certification scheme. The generated credits are used for achieving the goals of the Commitment to a Low-Carbon Society and for carbon offset, among others.

h) Development of Public Campaigns

The Government will work to enhance public and business operators’ awareness and understanding of the global warming issues, by providing clear and useful information about adverse impacts of global warming on the public and society backed by the latest scientific information, through dialog and various forms of media. In this way, the Government will aim to foster a spirit of understanding and cooperation towards the global warming countermeasures while encouraging people to change their lifestyles towards the ones appropriate for a low-carbon society, and establishing the benefits of such changes.

For the sake of this purpose, actions on Cool BIZ, Warm BIZ, carbon offset mechanism, eco-driving, and car sharing will be promoted.

i) Technology Development for Global Warming Countermeasures

Developing and verifying technologies for global warming countermeasures are initiatives to realize the future reduction of a large amount of greenhouse gas emissions by promoting the expansion of greenhouse gas emission reductions and the decrease of reduction costs and thereby widely diffusing

them in society.

The Government will therefore promote the technological development and verification in order to realize the lower cost, higher efficiency and longer life etc. of renewable energy etc. and energy conservation.

Table 3-1 Progress in achievement of the quantified economy-wide emission reduction target: Information on mitigation actions and their effects (CTF Table 3)

Name of mitigation action ^a	Sector(s) affected ^b	GHG(s) affected	Objective and/or activity affected	Type of instrument ^c	Status of implementation ^d	Brief Description ^e	Start year of implementation	Implementing entity or entities	Estimate of mitigation impact (not cumulative, in kt CO ₂ eq)
2020									
Emissions Reduction of Energy-Originated CO₂									
Development of Low-Carbon Urban/Regional Structures and Socioeconomic Systems									
Promotion of Global Warming Countermeasures Based on the Action Plan of Each Local Government	Cross-Sectoral	CO ₂ , CH ₄ , N ₂ O, HFCs, PFCs, SF ₆	Support development of low-carbon communities which is coordinated with local city plans and led by local governments	Law/Standard Budget/Subsidy Awareness Raising	Implemented	Local governments will formulate and implement the local action plans based on the Act on Promotion of Global Warming Countermeasures (come in effect since 1998) which are expected to be coordinated with local city plans. The Government will provide guidelines for developing plans as well as support implementing actions based on their plans.	2008	MOE	-
Promotion of Developing Low-Carbon Community	Cross-Sectoral	CO ₂	Encourage low-carbonization of communities through concentrating city functions and low-carbonization of transport systems	Law/Standard Taxation Budget/Subsidy	Implemented	The Government will facilitate the formulation of low carbon city plans led by the local government based on "Low Carbon City Act (come in effect since December 2010)" as well as facilitate actions to integrate various urban functions, to promote the use of public transportation, to enhance efficiency of energy use, to preserve urban green areas, and to promote urban greening, based on the plans.	2012	MLIT, METI, MOE	-
Holistic and Efficient Use of Energy	Energy	CO ₂	Support the installation of, and promote the diffusion and extended usage of, innovative and cutting-edge system which utilizes area-wide energy use at block and district.	Budget/Subsidy Awareness Raising	Implemented	The Government will provide support to develop facilities which contribute to area-wide energy use with utilization possibility, innovativeness and leadership in multiple districts on the project areas.	2008	MLIT, METI	-
Industry Sector									
Promotion and Reinforcement of Voluntary Action Plans of Industry	Energy Industry/Industrial Processes	CO ₂	Reduce CO ₂ emissions from the industry, commercial, transport, and energy conversion sector by promoting voluntary and active activities of business operators to actively implement environmentally-friendly business actions on a voluntary basis with respect to the environment conservation.	Voluntary Agreement	Implemented	In industry sector, each industry group formulates and implements GHG emissions reduction plan (the Commitment to a Low Carbon Society) including 2020 emissions reduction target with an assumption of maximum use of world most-advanced low-carbon technologies (best available technologies, BAT). And the government will strictly assess and verify such initiatives.	Since 1997 (Depends on a group)	METI MOE Industry Group Related Ministries and Agencies (for Assessment and Verification)	NE
	Energy	CO ₂	Reduce CO ₂ emissions from energy consumption in the manufacturing sector by promoting the diffusion of energy-saving equipment in the sector.	Budget/Subsidy Financing	Implemented	On the top of the introduction of various energy-efficient equipment and devices based on the Commitment to a Low Carbon Society, the Government will implement supporting programs to promote the diffusion of low-carbon industrial furnaces which lead to massive improvement of energy efficiency compared to conventional equipment and devices.	2008	METI	NE
Promotion of Introduction of Highly Energy-efficient Equipment and Devices	Energy	CO ₂	Reduce CO ₂ emissions from energy consumption by construction work by promoting the diffusion of low-fuel or low-carbon construction machinery.	Budget/Subsidy Financing Other	Implemented	The Government will certify, and support the introduction of, construction machinery which passes the given criteria of fuel efficiency and the machinery using leading technologies such as hybrid or electrically geared system.	2010	MLIT	NE
	Energy	CO ₂	Reduce CO ₂ emissions associated with energy consumption in agriculture and fishery sector by diffusing energy saving facilities/devices in greenhouse horticulture, appliances for agriculture, and fishing vessels.	Budget/Subsidy Awareness Raising Technology Development	Implemented	The Government will support the introduction of, and develop further technologies of, heat pump units to greenhouse horticulture, appliances for agriculture such as heating equipment using woody biomass, high-speed pudding machines, energy-efficient outboard motors for fishing vessels, and fish-luring lights using LED etc.	2007	MAFF	NE

Chapter 3 Progress in achievement of quantified economy-wide emission reduction targets and relevant information

Name of mitigation action ^a	Sector(s) affected ^b	GHG(s) affected	Objective and/or activity affected	Type of instrument ^c	Status of implementation ^d	Brief Description ^e	Start year of implementation	Implementing entity or entities	Estimate of mitigation impact (not cumulative, in kt CO ₂ eq)
2020									
Commercial and others									
Improving the Energy Efficiency of Equipment and Devices based on the Top Runner Program	Energy	CO ₂	Improve energy consumption when devices are used, through the continuous improvements in device quality by the Top Runner standard. (Devices currently subject to the program: industrial air conditioners, industrial electronic refrigerators, industrial electronic freezers, energy converters, multi-functional printers and electric water heaters)	Law/Standard Budget/Subsidy	Implemented	The Government will continue to reconsider about target devices for the Top Runner Programme that requires manufacturers and importers of products to meet criteria which is in line with standards for currently most-advanced devices and assumed technological advances in about 3 to 10 years. (LED light bulbs and other devices are already added on the list in 2013.) At the same time, consideration will be carried out in order to revise the standards on devices which reaches their target year.	1998	METI	NE
Improvement of the Energy Efficiency Performance and Low-Carbonization of Buildings	Energy	CO ₂	Reduce CO ₂ emissions from energy consumption in buildings by promoting their energy saving through "regulations," "assessment and display" and "providing incentives."	Law/Standard Budget/Subsidy Other	Implemented	Regarding newly constructed buildings, the Government will implement support to raise public awareness to encourage diffusion of the revised energy conservation standard. The Government will make it mandatory in stages to comply with energy conservation standards for newly constructed buildings by 2020. To promote further improvement of energy efficiency, the Government will promote diffusion of low carbon buildings with a higher energy-efficiency, and provide support for implementing pilot projects which can realize low CO ₂ emissions. The Top-Runner Program was introduced on construction materials, and thermal insulation material was added. And regarding existing buildings, the Government will pursue retrofits to improve energy efficiency, improvement of the use of equipment and devices, provision of consultation on potential capacity of GHG emissions reduction, promoted use of data of energy consumption and so on in order to improve the energy efficiency of the entire building stocks. Also the Government will discuss multilateral measures which are expected to be in need in the future specifically for replacing equipment with high-performed one. The Government will encourage the enhancement and diffusion of objective and clarified system for verifying and labeling of comprehensive environmental performances.	2003 (When the reporting period of energy-saving performance started, based on the Energy Saving Law)	MLIT, METI, MOE	NE
Smart Consumption of Energy by Using Energy Management etc.	Energy	CO ₂	Support the introduction of Energy Management Systems such as BEMS, HEMS and MEMS in order to promote wider diffusion of those systems.	Taxation Budget/Subsidy Other	Implemented	The Government will promote the introduction of smart-meter as infrastructure and install them in all households and plants in the early 2020s. At the same time, the Government will promote the introduction of Energy Management Systems (HEMS, BEMS, etc.) and the utilization of energy consumption data with the aim of optimizing energy consumption. Efficient energy management system will be introduced such as 'demand response', which adjusts energy demand in response to the energy supply condition. Also, the Government will support the introduction of technologies etc. for CO ₂ emissions reduction when developing social system such as water supply, sewage system, waste management and ICT.	1998 (Supporting programmes for business operators to enhance energy efficiency etc.)	METI, MOE, MIC, Related Ministries and Agencies	NE
Initiatives by Public Organizations	Energy	CO ₂	Implement necessary actions to achieve targets based on the commitment plans of each ministry and agency in accordance with the national commitment plan. In order to spur demands for products that contribute to greenhouse gas emissions reduction and other eco-friendly goods and services, the Government and independent administrative agencies etc. will promote the conversion of demand and they will make environmentally-conscious contracts which will contribute to GHG emissions reduction.	Law/Standard	Implemented	The Government will reduce greenhouse gas emissions with regard to its own administration and undertakings at a level which is equivalent or superior to initiatives in the current national commitment plan, even during the period before the new national commitment plan is formulated in line with the new plan for global warming prevention. The Government and independent administrative agencies etc. will take the initiative in procuring such goods and services that contribute to GHG emissions reduction as well as will make environmentally-conscious contracts which will contribute to GHG emissions reduction, mainly in six areas (namely supply of electricity, automobiles, vessels, ESCO, buildings, and industrial waste).	2001	All Ministries and Agencies	NE

Chapter 3 Progress in achievement of quantified economy-wide emission reduction targets and relevant information

Name of mitigation action ^a	Sector(s) affected ^b	GHG(s) affected	Objective and/or activity affected	Type of instrument ^c	Status of implementation ^d	Brief Description ^e	Start year of implementation	Implementing entity or entities	Estimate of mitigation impact (not cumulative, in kt CO ₂ eq)
2020									
Residential Sector									
Improving the Energy Efficiency of Equipment and Devices based on the Top Runner Program [reprinted]	Energy	CO ₂	Improve energy consumption when devices are used, through the continuous improvements in device quality by the Top Runner standard. (Devices currently subject to the program: industrial air conditioners, industrial electronic refrigerators, industrial electronic freezers, energy converters, multi-functional printers and electric water heaters)	Law/Standard Budget/Subsidy	Implemented	The Government will continue to reconsider about target devices for the Top Runner Programme that requires manufacturers and importers of products to meet criteria which is in line with standards for currently most-advanced devices and assumed technological advances in about 3 to 10 years. At the same time, consideration will be carried out in order to revise the standards on devices which reaches their target year.	1998	METI	NE
Improvement of the Energy Efficiency Performance and Low-Carbonization of Housing	Energy	CO ₂	Reduce CO ₂ emissions from energy consumption in houses by promoting energy saving in housing through "regulations," "assessment and display" and "providing incentives."	Law/Standard Taxation Budget/Subsidy Financing Technology Development Awareness Raising Other	Implemented	Regarding newly constructed houses, the Government will implement support to raise public awareness to encourage diffusion of the revised energy saving standard. The Government will make it mandatory in stages to comply with energy conservation standards for newly constructed houses by 2020. In order to develop an enabling environment for such measures, the Government will support the improvement of the energy-saving design and construction techniques of small- and medium-sized builders and carpenters who are the main player for house supply, as well as the arrangement of evaluation system of energy saving performance. To promote diffusion of low carbon houses with a higher energy-efficiency, and for implementing pilot projects which will lead to low CO ₂ emissions. The Top-Runner Program was introduced on construction materials, and thermal insulation material was added. And regarding existing houses, the Government will pursue retrofits to improve energy efficiency, improvement of the use of equipment and devices, provision of consultation on potential capacity of GHG emissions reduction, promoted use of data of energy consumption and so on in order to improve the energy efficiency of the entire house stocks. Also the Government will discuss multilateral measures which are expected to be in need in the future specifically for replacing equipment with high-performed one. The Government will encourage the enhancement and diffusion of objective and clarified system for verifying and labelling of comprehensive environmental performances.	2003 (When the reporting period of energy-saving performance started, based on the Energy Saving Law)	MLIT, METI, MOE	NE
Promotion of Combined Heat and Power and Household Fuel Cells	Energy	CO ₂	Reduce CO ₂ emissions from energy consumption in houses by promoting the introduction of combined heat and power such as fuel cells for household use.	Budget/Subsidy Technology Development	Implemented	Since simultaneous generation and use of electricity and heat enables effective consumption of energy, the Government promotes the diffusion of combined heat and power such as household fuel cells.	2009	METI	NE
Other Supportive Measures	Energy	CO ₂	Promote innovative changes towards low-carbon lifestyle by providing information, "visualization" of CO ₂ emissions as well as promoting low-carbon activities.	Budget	Implemented	The Government will work on the "visualization" of CO ₂ emissions by various product type by displaying information on emissions and other items during the product's life cycle. Moreover, the Government will work to promote innovative changes towards low-carbon lifestyle through the introduction of Home Energy Management Systems (HEMS), which operates lighting, air conditioners and other devices to optimally adjust to interior conditions, promotion of the use of HEMS data, and promotion of "Home CO ₂ advisor service".	2010	MOE, METI	NE

Chapter 3 Progress in achievement of quantified economy-wide emission reduction targets and relevant information

2020									
Transport Sector									
Improvement in the Fuel Efficiency of Vehicles and Diffusion of Them (Measures for each vehicle as a unit)	Transport	CO ₂	Reduce CO ₂ emissions from energy consumption in the transport sector by supporting the introduction of highly energy-efficient next-generation automobiles (hybrid vehicles (HEV), plug-in hybrid vehicles (PHEV), fuel-cell vehicles (FCV), clean diesel vehicles (CDV) and promoting the extensive diffusion of those automobiles, while continuing to improve the performance of vehicles according to fuel efficiency standards.	Law/Standard Taxation Budget/Subsidy Technology Development	Implemented	For electric vehicles, the Government will promote the development of recharging infrastructure, support the purchase of vehicles to create mass production effects and to promote price reduction, and also support research and development to extend a cruising range and reduce the production costs. In order to enable the release of fuel-cell vehicles to the market in 2015, the Government will review regulations on fuel-cell vehicles and hydrogen infrastructure and support the introduction of hydrogen stations. And the Government will promote further improvement of performance of automobiles through fuel efficiency standards (as the "Top Runner Standard") and take preferential tax treatment measures targeted at gasoline-based vehicles in accordance with their fuel efficiency.	1979 (When the Fuel Efficiency Standards were determined based on the Energy Saving Law)	MLIT, METI	NE
Promotion of Traffic Flow Management/Promotion of the Environmentally-friendly Usages of Vehicles	Transport	CO ₂	Reduce CO ₂ emissions from energy consumption in the transport sector through the following measures: improving the main traffic network using loop roads, and promoting the development of Intelligent Transport Systems (ITS) and roads for bike.	Budget/Subsidy Awareness Raising	Implemented	The Government will improve the main traffic network using loop roads which is ineffective to reduce CO ₂ emissions and will provide information which is effective for drivers to select the best routes to their destinations, such as information on traffic congestions, by utilizing Intelligent Transport System (ITS) spots set on highways. The Government will also rearrange the traffic environment for bike users.	2012 (Priority Plan for Social Infrastructure Development)	MLIT	NE
Promotion of the Use of Public Transports	Transport	CO ₂	Reduce CO ₂ emissions from energy consumption in the transport sector by improving the service and convenience of trains and buses as well as promoting eco-commuting.	Taxation Budget/Subsidy Awareness Raising	Implemented	The Government will reconstruct the public transport networks in communities and improve their convenience by installing BRT and LRT, developing new line railroad, installing transport connection information system and location system for buses etc.	1992	MLIT	NE
Promoting Low-Carbonization of Railway, Vessel and Aviation)	Transport	CO ₂	Reduce CO ₂ emissions from energy consumption in the transport sector by promoting the development and introduction of energy-efficient railways, vessels and aircraft.	Taxation Budget/Subsidy Financing Technology Development	Implemented	The Eco-Rail Line project, which will implement the introduction of highly energy efficient vehicles and renewable energy to railway facilities etc. will be promoted. Manufacturing of "super-eco ships" and alternation to the manufacturing of vessels with energy-efficient equipment will be promoted. The Government will promote efficient operating method for aircrafts and low-carbonization of airport facilities including increased use of ground power unit (GPU) etc.	2005	MLIT	NE
More Efficient Logistics/Modal shifts etc.	Transport	CO ₂	Reduce CO ₂ emissions from energy consumption in the transport sector by improving the efficiency of truck transport and promoting modal shifts to trains and coastal shipping.	Taxation Budget/Subsidy Financing Awareness Raising	Implemented	The Government will improve the efficiency of truck transport by encouraging the use of larger trucks such as large CNG trucks and promoting cooperative transport and delivery by logistics operators etc. within regions. Introduction of large containers (over 31ft), which is efficient to promote phasing out from larger trucks use and promotion of the "Eco-Rail Mark" etc. will be promoted to achieve the modal shift to rail freight transport and introduction of trucks with separable trailers and promotion of the "Eco-Ship Mark" etc. will be promoted to achieve the modal shift to coastal shipping. The Government will aim at further reduction of environmental load by strengthening a partnership between owners of goods and operators of logistics.	2001	MLIT, MOE, METI	NE

Name of mitigation action ^a	Sector(s) affected ^b	GHG(s) affected	Objective and/or activity affected	Type of instrument ^c	Status of implementation ^d	Brief Description ^e	Start year of implementation	Implementing entity or entities	Estimate of mitigation impact (not cumulative, in kt CO ₂ eq)
2020									
Energy Conversion Sector									
Promotion of Power from Renewable Energy Sources	Energy	CO ₂	Reduce CO ₂ emissions from energy supply by promoting the thorough use of renewable energies such as onshore/offshore wind power, solar power, small-scale hydro power, geothermal power and biomass.	Law Budget/Subsidy Taxation Technology Development	Implemented	<p>The Government will steadily and stably operate feed-in-tariff scheme on renewable energies.</p> <p>In terms of wind power generation, the Government will promote its introduction by regulatory and institutional reform including the streamlining the procedure of environmental impact assessment and rationalization of safety regulations urgent introduction of large storage batteries for the power system, creating a condition for early strengthening of Hokkaido-Honshu Electric Power Interconnection Facility, and the rearrangement and operation tests for the power grid.</p> <p>For the promotion of geothermal power generation, the Government will work on the regulatory and institutional reform including streamlining the procedure of environmental impact assessment and rationalization of the safety regulations to enhance the use of small-scale geothermal power generation using the existing wells at hot springs, and promote understanding of people in the local level.</p> <p>For biomass energy, the Government will focus on the promotion of industrialization and introduction of biomass energy by establishing the framework to promote actions aiming at developing the primary sector with using the renewable energy and achieving the use of local biomass energy in approximately 100 regions in 5 years. The Government will support arrangement of infrastructure and conduct technological demonstration etc. for the energy use of urban biomass use such as sewage sludge.</p> <p>The government aims to overcome technical challenges of offshore floating wind power generation, establish evaluation methods for safety, reliability and economic aspect and environmental assessment method through demonstration projects by 2015. At the same time, the government will achieve commercialization by around 2018 while promoting establishment of international standards.</p>	n/a	METI MOE Related Ministries and Agencies	NE
More Efficient Thermal Power Generation	Energy	CO ₂	Advance introduction of highly efficient thermal power generation (coal/LNG) with environmental considerations, and make efforts to improve power generation efficiency further by advancing technology development with regard to the clarified and accelerated environmental assessment agreed by the Ministry of the Environment and the Ministry of Economy, Trade and Industry.	Law/Standard Budget/Subsidy Technology Development	Implemented	<p>The Government will promote development of framework for managing CO₂ emissions with participation of the whole stakeholders of power generation, which should be consistent with the national GHG emissions reduction target based on the review of energy policies and energy-mix. And environmental assessments will be implemented with the focus of applying most-advanced technologies of electricity generations etc. which have already been commercialized and under operation. Speeding-up the process of environmental assessment on replacements and introduction/expansion of thermal power plants will also be promoted.</p> <p>The Government will promote technology development of the Advanced Ultra-Supercritical pressure steam power plants, the Integrated Coal Gasification Fuel Cell Combined Cycle (IGFC), and LNG gas turbines of 1700°C, which aims at commercialization of the technologies.</p> <p>Concerning carbon dioxide capture and storage (CCS), the Government will accelerate technological development for practical use around 2020s and conduct survey on potential CO₂ storage sites for CCS precondition in order to obtain outcomes at an early date. Also the Government will consider the possibility of coal thermal power plants being equipped with CCS by 2030 on the precondition of commercialization, make it clear what to expect on CCS Ready along with considerations about the progress of survey on the sites and commercialization, and consider the possibility of the introduction of CCS Ready as early as possible.</p>	n/a	METI, MOE	NE

Chapter 3 Progress in achievement of quantified economy-wide emission reduction targets and relevant information

Name of mitigation action ^a	Sector(s) affected ^b	GHG(s) affected	Objective and/or activity affected	Type of instrument ^c	Status of implementation ^d	Brief Description ^e	Start year of implementation	Implementing entity or entities	Estimate of mitigation impact (not cumulative, in kt CO ₂ eq)
2020									
Emissions Reduction of Non Energy -originated CO ₂									
10000									
Increased Use of Blended Cement	Industry/Industrial Processes	CO ₂	Reduce CO ₂ emissions in the cement production process by reducing the production volume of clinker through increased production proportion and expanded use of blended cement, which is made by mixing blast-furnace slag with clinker, an intermediate cement product.	Law/Standard Awareness Raising	Implemented	Based on the Law Concerning the Promotion of Procurement of Eco-Friendly Goods and Services by the State and Other Entities (Green Purchasing Law), the Government will encourage the use of blended cement in public construction. Buildings using blended cement will be certificated as low-carbon buildings based on the "Low Carbon City Act".	Year 2001 (Based on the Green Purchasing Law, blended cement is designated as the eco-friendly goods.)	MOE, METI	660
Promotion of Waste Reduction and Recycling	Waste Management/Waste	CO ₂	Reduce CO ₂ emissions from waste incineration by promoting the waste reduction and recycling.	Law/Standard Budget/Subsidy Awareness Raising	Implemented	The Government will promote 3 Rs initiatives for achieving the targets set out in the "Basic Plan for Establishing a Recycling-Based Society", formulated in accordance with the "Basic Act on Establishing a Sound Material-Cycle Society" (Basic Recycling Law) as well as the waste reduction targets set out in the "Waste Management and Public Cleansing Law" in line with the target set in Basic Recycling Law. Specifically, the Government will promote waste reduction and recycling by thorough waste sorting and collection as well as imposition of charges for waste collection by municipal governments, actions complying with individual Recycling Laws and actions based on the Guidelines for Controlling Greenhouse Gas Emissions. Also, the amount of incinerated wastes will be reduced by promoting the arrangement of waste disposal facilities which contribute to the realization of 3Rs in line with the waste disposal facilities development plan based on the "Waste Management and Public Cleansing Law".	2013 MOE		200 Note 2
Emissions Reduction of Methane									
5000									
Reducing Direct Landfill Disposal of Organic Waste	Waste Management/Waste	CH ₄	Reduce methane emissions associated with waste landfill, by promoting the reduction of organic waste such as garbage going directly to landfill.	Law/Standard Budget/Subsidy Awareness Raising	Implemented	The Government will promote 3 Rs initiatives for achieving the targets set out in the "Basic Plan for Establishing a Recycling-Based Society", formulated in accordance with the "Basic Act on Establishing a Sound Material-Cycle Society" (Basic Recycling Law) as well as the waste reduction targets set out in the "Waste Management and Public Cleansing Law" in line with the target set in Basic Recycling Law. Specifically, the Government will promote waste reduction and recycling by thorough waste sorting and collection as well as imposition of charges for waste collection by municipal governments, reducing illegal dumping of industrial wastes through more strict waste disposal systems and the development of model disposal operators, and actions complying with individual Recycling Laws and actions based on the Guidelines for Controlling Greenhouse Gas Emissions. At the same time, the Government will reduce the amount of direct landfill of organic waste by promoting the improvement of the systems for waste disposal facilities of municipalities, including through banning the direct disposal to landfill of organic wastes in principle, in accordance with the waste disposal facilities development plan based on the "Waste Management and Public Cleansing Law".	2013 MOE		400 Note 2
Improvement of the Management of Organic Matter and Water	Agriculture	CH ₄	Reduce methane emissions associated with rice cultivation by promoting the replacement from plowing in rice straw which has relatively higher methane emission intensity with application of compost which has lower emission intensity.	Law/Standard Budget/Subsidy	Implemented	The Government will support the initiatives to enable replacing the conventional approach of plowing in rice straw with application of compost such as installing compost generating facilities and converting agricultural activities into ones which are effective for global warming mitigation. Through the reduction of methane emissions, the Government will contribute to sustainable agricultural production harmonized with the environment.	2007 MAFF		NE

2000									
Emissions Reduction of Nitrous Oxide									
Upgrading Combustion Technology at Sewage Sludge Incineration Facilities	Waste Management/Waste	N ₂ O	Reduce nitrous oxide from the incineration of sewage sludge by improving the incineration technology of facilities for sewage sludge and converting it into solid fuel.	Taxation Budget/Subsidy Technology Development	Implemented	The Government will support the development of turbo incinerators and will support construction and update of high-temperature incinerators. The Government will also conduct practical research of technologies of solid fuel power generator which uses waste heat, and will provide tax exemption on investing in obtaining facilities for storing solid fuel derived from sewage mire.	2001 (the level of sophistication of combusting sewage sludge at sewage treatment facilities was standardized)	MLIT	NE
Upgrading Combustion Technology at General Waste Incineration Facilities	Waste Management/Waste	N ₂ O	Reduce nitrous oxide from waste incineration by promoting more advanced incineration technology for facilities for general waste and the 3Rs for waste products.	Law/Standard Budget/Subsidy Awareness Raising	Implemented	The Government will promote the upgrade of combustion technology at general waste incineration facilities such as implementing consecutive operation of consecutive incinerator. The Government will reduce the amount of waste incineration by promoting the 3Rs initiatives for achieving the targets set out in the "Basic Plan for Establishing a Recycling-Based Society", formulated in accordance with the "Basic Act on Establishing a Sound Material-Cycle Society" (Basic Recycling Law) as well as the waste reduction targets set out in the "Waste Management and Public Cleansing Law" in line with the target set in Basic Recycling Law, and by promoting the arrangement of waste disposal facilities which contribute to the realization of 3Rs in line with the waste disposal facilities development plan based on the "Waste Management and Public Cleansing Law".	2013 MOE		NE
Appropriation and Reduction of the Amount of Fertilizer Used	Agriculture	N ₂ O	Reduce nitrous oxide emissions associated with the application of fertilizers through the use of lower fertilizer application rates, split-application regimes and slow-release fertilizers.	Law/Standard Budget/Subsidy	Implemented	For nitrous oxide associated with the application of fertilizers, the Government will provide support for fertilization plan revision to reduce amount of fertilizer as well as agricultural activities which are effective for the global warming mitigation. Through the reduction of nitrous oxide, the Government will contribute to sustainable agriculture production harmonized with the environment.	2007 MAFF		NE
Emissions Reduction of Fluorinated Gases									
Holistic Policies to Reduce the Emissions of Fluorinated Gases	Industry/Industrial Processes	HFCs	Control the emission volume of fluorocarbons by promoting the rational use of fluorocarbons by the person concerned at each stage of the life cycle of fluorocarbons and also by promoting the proper management of fluorocarbons.	Law/Standard Taxation Budget/Subsidy Technology Development Awareness Raising Education Voluntary Agreement	Implemented	According to the Act on Rational Use and Proper Management of Fluorocarbons (June 2013), the Government will work on the following: practically phasing down fluorocarbons by gas suppliers, eliminating fluorocarbons from products and lowering GWP of products by manufacturers of equipment and products, preventing leakage of fluorocarbons from refrigeration and air conditioning equipment for business use during normal operation period by end-users, and enhancing and strengthening regulations on recycling and destruction programs. In addition, the Government will promote the technological development of fluorocarbon-free equipment and support for the introduction of such equipment as well as the promotion of the Voluntary Action Plan in industry.	2001 (Fluorocarbons Recovery and Destruction Law was adopted)	MOE, METI	9,700 Note 3

Chapter 3 Progress in achievement of quantified economy-wide emission reduction targets and relevant information

Name of mitigation action ^a	Sector(s) affected ^b	GHG(s) affected	Objective and/or activity affected	Type of instrument ^c	Status of implementation ^d	Brief Description ^e	Start year of implementation	Implementing entity or entities	Estimate of mitigation impact (not cumulative, in kt CO ₂ eq)
2020									
Greenhouse Gas Sink Policies									
Forest Sink Strategies	LULUCF	CO ₂	Maintain and strengthen the CO ₂ absorption functions of forests through appropriate management of forests such as thinning.	Law/Standard Budget/Subsidy Technology Development Awareness Raising	Implemented	In accordance with "Basic Plan for Forest and Forestry" and "Act on Special Measures concerning Advancement of Implementation of Forest Thinning, etc." (2013), the Government will aim to secure the upper forest absorption level agreed in COP17, 3.5% (average of the period from 2013 to 2020) and contribute to the forest sector in the future. In order to achieve these objectives, the Government will work on the following through a variety of policy approaches: appropriate forest development such as thinning and afforestation, the proper management and preservation of protected and other forests, promoting the use of timber and woody biomass, promoting forest development programs where people participate in, accelerated implementation of initiatives to establish sustainable forest management practices, and promoting measures to diffuse seeds and seedlings that grow well.	2007	MAFF	38,000 Note 4
Measurement for Sink Source in Agricultural Soil	LULUCF	CO ₂	Improve the carbon storage in both agricultural lands and pasture soils to enhance carbon sink.	Law/Standard Budget/Subsidy Technology Development Awareness Raising	Implemented	It is proven that the carbon storage in Japanese agricultural lands and pasture soils can be increased by continuous usage of organic matter in fertilizers and green manures. By promoting these methods, it contributes to the increased carbon storage in both agricultural lands and pasture soils.	2008	MAFF	NE
Promotion of Urban Greening	LULUCF	CO ₂	Promote urban greening to preserve and strengthen their carbon sink capacity.	Law/Standard Budget/Subsidy Technology Development Awareness Raising	Implemented	Actions will be promoted such as park maintenance, greening in roads and bays, and creation of the new greening spaces at buildings. Improvement in report and verification system for the urban greening will also be strategically carried out.	2006	MLIT	NE

2020									
IE									
Cross-Sectoral Policies									
GHG Emissions Accounting, Reporting and Disclosure Program	Cross-Sectoral	CO ₂ , CH ₄ , N ₂ O, HFCs, PFCs, SF ₆	Make it mandatory for those who exceed more than a certain amount of greenhouse gas emissions to calculate emission volume and report it to the Government. The reported data is collected and published by the Government.	Law/Standard Budget/Subsidy Awareness Raising	Implemented	The Government will further enhance and strengthen a system for accounting, reporting and disclosing greenhouse gas emissions data while steadily operating it in accordance with the Act on Promotion of Global Warming Countermeasures.	2006	MOE, METI	-
Making the Tax System Greener	Cross-Sectoral	CO ₂	The Government will pursue greening of the entire tax system including energy and vehicle taxes.	Taxation	Implemented	The Government will utilize the tax revenue of "Tax for Climate Change Mitigation", designed to add an extra tax multiplier commensurate with CO ₂ emission levels from the all fossil fuel combustion and will firmly implement the various policies to curb energy-originated CO ₂ emissions. Additionally, the Government will also strengthen greener taxation system on vehicle taxes by ensuring the concept of "Reducing taxes for Goods, Increasing taxes for Bads" according to the environmental impact.	n/a	MOE	-
Promotion of Environmentally-conscious business activities	Cross-Sectoral	CO ₂ , CH ₄ , N ₂ O, HFCs, PFCs, SF ₆	Formulate and publish the guidelines for measures to be taken by business operators in controlling greenhouse gas emissions generating from their business activities.	Law/Standard Budget/Subsidy Awareness Raising	Implemented	The Government will promote voluntary and active actions by business operators to implement environmentally-conscious business activities through the formulation of 'Guidelines for Controlling Greenhouse Gas Emissions' based on the Law for Promotion of Global Warming Countermeasures. In addition, the Government will review the guidelines based on the trends of available cutting-edge technologies in the fields.	2008	MOE, METI, MAFF	-
Greening Finance	Cross-Sectoral	CO ₂ , CH ₄ , N ₂ O, HFCs, PFCs, SF ₆	Develop support measures to stimulate private investments in greenhouse gas reduction measures by supporting low-carbon projects through investments and promoting the use of lease methods. The Government will promote loans based on environmental responsibility ratings and socially responsible investments (SRI).	Budget/Subsidy Awareness Raising	Implemented	The Government will establish a fund for promoting regional low-carbon investments that invests in low-carbon projects in order to stimulate private investment. To reduce the burdens of a large amount of initial investment costs for households and business operators, the Government will subsidize them when they lease low-carbon equipment. The Government will promote environmental finance by providing interest subsidies and support the principles for financial action towards a sustainable society, etc.	2007	MOE	-
Promoting J-Credit system	Cross-Sectoral	CO ₂ , CH ₄ , N ₂ O, HFCs, PFCs, SF ₆	Certify greenhouse gas emission reductions and absorptions in Japan.	Budget/Subsidy	Implemented	The Government will operate a system that certifies emission reductions and absorptions in Japan as J-credits, which can be used for various purposes such as achieving the goals of the Commitment to a Low-Carbon Society as well as carbon offsets.	2013	MOE, METI, MAFF	-
Developing Public Campaigns	Cross-Sectoral	CO ₂ , CH ₄ , N ₂ O, HFCs, PFCs, SF ₆	Foster the understanding of global warming countermeasures and promote the transformation of lifestyle habits into one that are appropriate for a low carbon society as well as the penetration of its effects.	Budget/Subsidy Awareness Raising	Implemented	The Government will enhance public understanding of global warming issues by providing clear information on adverse impacts of global warming. In addition, the Government will aim to transform the current lifestyle of people into the one appropriate for a low carbon society, by promoting "Cool Biz," "Warm Biz," and carbon offsets as well as the diffusion of eco-drive and car sharing.	2005	MOE	-

^{a1}: Targets will be reviewed based on the progress of discussions about forthcoming energy policy and energy mix etc., and emissions reduction effect of energy-originated CO₂ through each policy will also be scrutinised.

^{a2}: Estimated figures of mitigation impacts of 'Promotion of Waste Reduction and Recycling' in 'Emissions Reduction of Non Energy-originated CO₂' and 'Reducing Direct Landfill Disposal of Organic Waste' in 'Emissions Reduction of Methane' are under scrutiny. Mitigation impacts of other policies for emissions control of non energy-originated CO₂, methane and nitrous oxide as well as greenhouse gas sink will also be scrutinised.

^{a3}: Mitigation impact of 'Holistic policies to reduce the emissions of fluorinated gases' is estimated to be 9,700-15,600ktCO₂.

^{a4}: Mitigation impact of 'Forest Sink Strategies' is estimated to be more than 38,000ktCO₂.

3.2. Estimates of emission reductions and removals and the use of units from the market-based mechanisms and land use, land-use change and forestry activities

The information on the estimates of emission reductions and removals and the use of units from the market-based mechanisms and land use, land-use change and forestry activities for 2010, 2011 and 2012 related to the progress in achievement of quantified economy-wide emission reduction targets of Japan is the follows.

Table 3-2 Reporting of progress (CTF Table4)

Year ^c	Total emissions excluding LULUCF	Contribution from LULUCF ^d	Quantity of units from market based mechanisms under the Convention		Quantity of units from other market based mechanisms	
	(kt CO ₂ eq)	(kt CO ₂ eq)	(number of units)	(kt CO ₂ eq)	(number of units)	(kt CO ₂ eq)
(2005)	1,351,406.69	NA		NA		NA
2010	1,257,380.64	49,802.91		0.00		0.00
2011	1,307,728.35	52,187.72		0.00		0.00
2012	NE	NE		0.00		0.00

Chapter 4 Projection

4.1. Projection

4.1.1. Overview

Japan's greenhouse gas emission reduction and removal target is a 3.8% emission reduction in 2020 compared to the 2005 level (1,351 million t-CO₂ equivalent). Emission reduction targets and projections in FY2020 for each specific greenhouse gas (GHG), namely carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF₆) and nitrogen trifluoride (NF₃), are set as shown below.

4.1.2. Energy-originated CO₂

Energy-originated CO₂ covers more than 90% of Japan's GHG emission. Based on statistics, it could be broken down into 5 sectors: Industry; Commercial and other; Residential; Transport; and Energy conversion. The effects of policies and measures can be observed in each sector as well. Table 4-1 shows emission projection for each sector. This is an indicative level which is estimated to be achievable with the economic growth currently expected and where policies for each sector on energy demand accomplish expected outcomes. It is necessary to note that emission levels shown in Table 4-1 are indicative levels, estimated using emission intensity in FY2012, which is the latest results, because projection on nuclear power plant activities for FY2020 is currently unavailable and emission factor for power generation in FY2020 is unable to be set. The estimation figures may vary depending on future circumstances.

*Estimated indicative targets in each sector are set under the expectation that final energy consumption will be reduced by: -2 million kl (-1.1%) in industry, -5 million kl (-6.5%) in commercial and others, -10 million kl (-17.9%) in residential and -25 million kl (25.8%) in transport sector compared to FY2005 with policies and measures which are considered to be available at this point. These estimated targets will be reviewed based on consideration of energy policies and energy mix.

Table 4-1 Estimated emissions of energy-originated CO₂ in each sector

	Base year (FY2005)	FY2012 (preliminary figures)	Estimated emissions of each sector in FY2020	
	A	-	B	(B-A)/A
	Million t-CO ₂	Million t-CO ₂	Million t-CO ₂ (Note 1)	(Increase rate of each sector compared to base year)
Energy-originated CO ₂	1,203	1,207	1,208	+0.4%
Industry	459	431	484	+5.4%
Commercial and Other	236	259	263	+11.4%
Residential	174	203	176	+1.1%
Transport	254	227	190	-25.2%
Energy conversion (Note 2)	79	86	95	+20.3%

(Note 1) Because projection on nuclear power plant activities for FY2020 is currently unavailable and emission factor for power generation in FY2020 is unable to be set, these figures were estimated using emission intensity in FY2012, which is the latest result.

(Note 2) Because power supply mix in FY2020 is currently unavailable, the future energy consumption of own use in power plants is unavailable as well. Hence, the energy consumption level for FY2020 is assumed to be the same as in FY2005.

4.1.3. Non-energy-originated CO₂

The target for non-energy-originated CO₂ is set as -12.5% (approximately 70 million t-CO₂) compared to FY2005.

4.1.4. Methane

The target for methane is set as -21.7% (approximately 18 million t-CO₂) compared to FY2005.

4.1.5. Nitrous oxide

The target for nitrous oxide is set as -8.3% (approximately 22 million t-CO₂) compared to FY2005.

Table 4-2 Estimated emissions of non-energy-originated CO₂, methane and nitrous oxide

	Base year (FY2005)	Estimated emission amount of each gas in FY2020	
	A	B	(B-A)/A
	Million t-CO ₂	Million t-CO ₂	Compared to base year
Non-energy-originated CO ₂	80	70	-12.5%
Methane	23	18	-21.7%
Nitrous oxide	24	22	-8.3%

(Note) The Global Warming Potentials, based on the IPCC Second Assessment Report, are used.

4.1.6. Fluorinated gases

Since refrigerants in refrigerators and air-conditioners have shifted from HCFCs, which are ozone depleting substances, to HFCs, it is expected that the emissions of fluorinated gases (HFCs, PFCs, SF₆ and NF₃) will increase. The goal is set as no more than +109.1% (approximately 46 million t-CO₂) emissions compared to CY2005. However, since estimation for some HFCs, PFCs and NF₃ are not available at this point, the estimation of these gases are excluded.

It is necessary to note that the figures may vary depending on future circumstances. Particularly, in regards to HFC refrigerants, due to the enactment of the “Act on Rational Use and Proper Management of Fluorocarbons” in 2013, shifting to non-fluorocarbon and low-GWP refrigerants as well as improving management of refrigerants will be implemented, which will lead to substantial emissions reduction. The result is expected to save 9.7 million to 15.6 million t-CO₂ compared to the case where no additional actions are implemented. After measures of the above-mentioned law are concretized, the figure with additional measures will be reviewed. Thus, the mitigation effect of this law is not reflected in Table 4-3. Instead, the figure is based on the case where no additional actions are implemented.

Table 4-3 Estimated emissions of fluorinated gases and each gas

	Base year (FY2005)	Estimated emissions of fluorinated gases and each gas	
	Million t-CO ₂	Million t-CO ₂ (Note 1)	Compared to base year
Fluorinated gases	22	46	+109.1%
HFCs	11	41	+272.7%
PFCs	7	3	-57.1%
SF ₆	5	2	-60.0%
NF ₃ (Note 2)	-	-	-

(Note) The Global Warming Potentials, based on the IPCC Second Assessment Report, are used.

(Note 1) Expected reduction effect by “Law for Partial Amendment to Law Concerning the Recovery and Destruction of Fluorocarbons” in 2013 is not reflected in the table. The figure is planned to be reviewed after measures of the above-mentioned law are concretized.

(Note 2) Emissions of some HFCs, PFCs and NF₃, additional gases for the second commitment period of the Kyoto Protocol as agreed at the COP 17 and other conferences, are not estimated and reflected in this table.

4.1.7. CO₂ removals by sinks

With regard to forest carbon sinks, the target was determined that the amount of removals by forest management for the period between 2013FY and 2020FY will be, on average, 3.5% of the total GHG emissions in 1990FY (approximately 44 million t-CO₂), which is the agreed upper limit of removals by forest management for the second commitment period of the Kyoto Protocol. The level of removals will correspond with approximately 2.8% or more of the total GHG emissions in 2005FY (approximately 38 million t-CO₂).

4.1.8. Summary

Estimated emissions of each greenhouse gas in 2020 are as follows.

Table 4-4 Information on greenhouse gas projections under a 'with measures' scenario (CTF Table6(a))

	GHG emissions and removals ^b								GHG emission projections	
	(kt CO ₂ eq)								(kt CO ₂ eq)

Abbreviations : GHG = greenhouse gas, LULUCF = land use, land-use change and forestry.

^a In accordance with the "Guidelines for the preparation of national communications by Parties included in Annex I to the Convention, Part II: UNFCCC reporting guidelines on national communications", at a minimum Parties shall report a 'with measures' scenario, and may report 'without measures' and 'with additional measures' scenarios. If a Party chooses to report 'without measures' and/or 'with additional measures' scenarios they are to use tables 6(b) and/or 6(c), respectively. If a Party does not choose to report 'without measures' or 'with additional measures' scenarios then it should not include tables 6(b) or 6(c) in the biennial report.

^b Emissions and removals reported in these columns should be as reported in the latest GHG inventory and consistent with the emissions and removals reported in the table on GHG emissions and trends provided in this biennial report. Where the sectoral breakdown differs from that reported in the GHG inventory Parties should explain in their biennial report how the inventory sectors relate to the sectors reported in this table.

^c 20XX is the reporting due-date year (i.e. 2014 for the first

^d In accordance with paragraph 34 of the "Guidelines for the preparation of national communications by Parties included in

^e To the extent possible, the following sectors should be used: energy, transport, industry/industrial processes, agriculture,

^f Parties may choose to report total emissions with or without LULUCF, as appropriate.

Custom Footnotes

Because projections of CO₂, CH₄, N₂O emissions including from LULUCF for 2020 have not been estimated, the "Total with LULUCF" for 2020 is just only the total amount of HFC, PFC and SF₆ emissions.

The emission intensity for FY2012 is used to project energy-originated CO₂ in the estimation for "Total without LULUCF" for 2020. Also, the emission reduction impact from measures such as refrigerant management is not reflected in the emissions from the fluorinated gases.

4.2. Estimation Method

4.2.1. Approaches to projection

4.2.1.1. Target gases

For future emission estimations, six sorts of gases are covered: carbon dioxide, methane, nitrous oxide, HFCs, PFCs and SF₆.

Emissions for some HFCs, PFCs and NF₃, which are additional gases for the second commitment period of the Kyoto Protocol as agreed at the COP17 and other such conferences, are not estimated and covered.

4.2.1.2. Estimation method

Taking into account the projections on economic growth rate and population etc., the GHG emissions are calculated based on the estimation method as indicated in 4.2.2. to 4.2.4.

(Reference) Estimation for 2020, as formulated by the government

Assumption	Unit	Results				Estimation
		1990	2000	2005	2010	2020
Actual GDP	Trillion JPY (at chained 2005 prices)	-	476.72	507.16	510.99	610.6
Nominal GDP	Trillion JPY	-	510.83	505.35	479.20	620.7
Total population	Thousands	123,611	126,926	127,768	128,057	124,100
Private households	Thousands	40,670	46,782	49,063	51,842	53,053

*GDP

Estimation: Cabinet Office “Mid- and Long-Term Estimation about Economic and Fiscal Policy”, (submitted to the Council on Economic and Fiscal Policy on 8.8.2013)

Total population

Results: Ministry of Internal Affairs and Communications “Population Census”

Estimation: National Institute of Population and Security Research “Population Projection for Japan (Assumptions of medium-variant fertility and medium-variant mortality)” (January 2012)

Private households

Results: Ministry of Internal Affairs and Communications “Population Census”

Estimations: National Institute of Population and Security Research “Household Projection for Japan (National-Level Estimation)”, (January FY2013)

4.2.2. Estimation method for energy-originated CO₂ emissions

Indicative levels have been set as estimated to be achievable with the economic growth currently

expected and where policies for each sector on energy demand accomplish expected outcomes. It is necessary to note that emission levels shown in Table 4-1 are indicative levels, estimated using emission intensity in FY2012, which is the latest results, because projection on nuclear power plant activities for FY2020 is currently unavailable and emission factor for power generation in FY2020 is unable to be set. The estimation figures may vary depending on future circumstances.

Table 4-5 Results and estimated emissions reduction of final energy consumption

Million kL (crude oil equivalent)

Sector	Results		Estimated emissions reduction in FY2020 compared to FY2005 (*)	
	FY2005	FY2012	Amount	Reduction rate (%)
Industry	182	160	-2	-1.1
Commercial and other	77	72	-5	-6.5
Residential	56	53	-10	-17.9
Transport	97	86	-25	-25.8
Total	413	371	-	-

(*) Because power supply mix in FY2020 is currently unavailable, the future energy consumption of own use in power plants is unavailable as well. Hence, the energy consumption level for FY2020 is assumed to be the same as in FY2005.

Reference: Agency for Natural Resources and Energy "FY2012 Energy Supply and Demand Report (Preliminary Report)"

Table 4-6 Energy consumption and emissions of energy-originated CO₂ in FY2012 (preliminary results)

Sectors	Energy consumption (Million kL) [FY2012]	Energy-originated CO ₂ emissions (Million t-CO ₂) [FY2012]
Industry	160	431
Commercial and other	72	259
Residential	53	203
Transport	86	227
Energy conversion	31	86

Reference: Agency for Natural Resources and Energy "FY2012 Energy Supply and Demand Report (Preliminary Report)"

Ministry of the Environment Japan "FY2012 GHG Emissions Data of Japan (Preliminary Data)"

4.2.3. Estimation method for non-energy-originated CO₂, CH₄, N₂O and Fluorinated gases

Based on estimation in the GHG inventory, projected future emissions are set in sectors shown in below.

Table 4-7 Target sectors in future estimation

Gases	Target sectors in estimation
CO ₂	Fugitive emissions from fuels
	Industrial processes
	Waste
CH ₄	Fuel combustion
	Fugitive emissions from fuels
	Industrial processes
	Agriculture
	Waste
N ₂ O	Fuel combustion
	Fugitive emissions from fuels
	Industrial process
	Solvent and other product use
	Agriculture
	Waste
Fluorinated gases	Industrial processes

Future emission is calculated based on estimation method of the GHG inventory. Fundamentally, estimation is based on calculation multiplying projected activity data by projected emission factor for each emission source. The projection in FY2012 onwards is estimated based on results from FY1990 to FY2011 in the GHG inventory. Emissions with GHG reduction measures are calculated by subtracting the estimated reductions in the future from estimated emissions without GHG reduction measures.

-Projection on activity data

Activity data projection is set based on government's projections including GDP, circumstances of related national policies as well as projections of related industries. When GHG reduction measures can affect activity data, the activity data will be amended based on strength of each reduction measures.

-Projection on emission factor

For emission sources without reduction measures, the emission factors in FY2011 are used, assuming that level of the technology and emission will remain the same as FY2011. For emission sources with reduction measures, emission factors are adjusted based on strength of each reduction measure from those in FY2011.

4.2.4. Estimation method for the amount of carbon sink in forests

The carbon removals by forests are estimated by a process as follows: the figures used for estimation are based on the 2020 target declared in the Basic Plan for Forest and Forestry which was revised in 2011; the net growth of forests is calculated by subtracting the amount of harvesting from the net stock changes of forests; then the net growth of forests is converted into CO₂

equivalent by multiplying a coefficient.

Table 4-8 Estimation of the amount of carbon sink in forests

Headings	Major Assumptions	Notes
Area of Forest	25.1million ha (2020)	Target declared in the Basic Plan for Forest and Forestry
Stock of Forests	5.2billion m ³ (2020)	Target declared in the Basic Plan for Forest and Forestry
Timber Supply	39million m ³ (2020)	Target declared in the Basic Plan for Forest and Forestry

Chapter 5 Provision of financial technological and capacity-building support to developing country Parties

5.1. Finance

In December 2009, Japan announced the assistance of approximately USD 15 billion including public and private financing, of which public finance comprises approximately USD 11 billion, for developing countries up to 2012 to address climate change (hereinafter referred to as the Fast-Start Finance). This Fast-Start Finance aims to assist developing countries, especially those making efforts to reduce GHG emissions as well as those which are vulnerable to the negative impacts of climate change, taking into account the developments in the international negotiations and the state of Japan's reconstruction after the Great East Japan Earthquake, an unprecedented disaster in 2011. Japan has made utmost effort to play its part of the commitment made by developed countries to provide 30 billion to developing countries in three years from 2010 to 2012 as agreed by the Cancun Agreements. Faced with the Great East Japan Earthquake occurred in 2011, Japan was determined to overcome the catastrophe and to continue to faithfully implement the commitment on the Fast-Start Finance to fulfill a positive role in the international community.

Japan's assistance to developing countries is composed of two main types of assistance. One is Official Development Assistance (ODA) such as grant aid, technical assistance, concessional loan and contribution to multilateral funds, which are implemented by relevant ministries and agencies, Japan International Cooperation Agency (JICA) and other institutions. The other includes Other Official Flow (OOF) such as co-financing of the Japan Bank of International Cooperation (JBIC), and private financing catalyzed by the basis of public financing.

Out of approximately USD 15 billion of the Fast-Start Finance announced in December 2009, USD 17.6 billion including public and private financing has been implemented as of December 2012. However, if the Fast-Start Finance is limited to projects or programs based on public financing newly implemented during the period between January 2010 and December 2012, the amount of the implemented assistance would be USD 13.5 billion. Taking into account the discussions at the UNFCCC negotiations, the Fast-Start Finance implemented by Japan from January 2010 onward and composed of public financing is explained more in detail as below.

As for the financial support for the developing countries beyond 2013 to address climate change, in the "Proactive Diplomatic Strategy for Countering Global Warming" made in November 2013, Japan made a financial pledge 1.6 trillion yen to assist developing countries to strengthen "partnership" with various countries and stakeholders. Japan will also strengthen partnership with developing countries in order to build foundations for promoting diffusion of low carbon technologies. The following are the

tangible policies described in the “Proactive Diplomatic Strategy for Countering Global Warming”.

-Mobilizing ODA, other official flows, and private finance, Japan will provide total 1.6 trillion yen (approx. 16 billion dollars) during the 3-year period between 2013 and 2015. (Among them, public finance amounts to 1.3 trillion yen (approx. 13 billion dollars).

-Effective assistance will be provided to small island developing states and other countries vulnerable to the negative impacts of climate change while prioritizing areas in disaster risk reduction. New schemes including stand-by loan for disaster recovery (Stand-by Emergency Credit for Urgent Recovery (SECURE)) and preferential terms for concessional loan will be utilized.

-To take a leadership role in assisting developing countries, Japan will utilize multilateral forums, such as cooperation with other countries for the Third UN World Conference on Disaster Reduction to be held in Japan in 2015.

-To achieve the long-term goal of mobilizing jointly \$100 billion per year of both public and private finance by 2020, various public financial instruments will be utilized in encouraging the participation of private companies in the climate change field and significantly increasing the private finance.

-The above-mentioned assistance programs will also contribute to the overseas diffusion of Japan’s highly competitive low-carbon technologies and infrastructure, and will build a win-win relation between Japan and the developing countries.

5.1.1. National approach to tracking and reporting provision of support

There are mainly 5 types for Japan’s Fast-Start Finance; i.e. (1) grant aid (2) loan (3) technical assistance (4) contribution to international organizations (5) OOF and others. Ministry of Foreign Affairs, Ministry of Agriculture, Forestry and Fisheries, Ministry of Economy, Trade and Industry, Ministry of the Environment, Ministry of Land, Infrastructure, Transport and Tourism and JICA are implementing agencies of the types (1)-(3). The type of (4) is contributions to the development organizations or multilateral funds such as GEF, CIF, UNDP, UNEP, WFP and ITTO, which are implementing agencies of this type of assistance. Regarding the type (5), relevant Japanese ministries and JBIC are the main implementing agencies. Ministry of Foreign Affairs gathers abovementioned information and compiles the Japanese Fast-Start Finance information.

5.1.2. Meeting Developing Country Needs

As Japan’s Fast-Start Finance, 952 projects have been implemented in as many as 114 countries as of December 2012. Through the Japanese Embassies and JICA’s overseas offices stationed in a number

of developing countries, the Japanese Government has been developing projects of the Fast-Start Finance in close consultation with the government of developing countries and international organizations in response to the needs of recipient countries. Japan has been providing assistance through various channels, including grant aid, concessional loan and technical assistance, taking into account local economic situations and content of projects.

5.1.3. Assistance through Bilateral and Regional Frameworks and Multilateral Channels

5.1.3.1. Overview

The main components of our assistance which amount to USD 13.5 billion as of December 2012 are as follows. It should be noted that Japan's assistance for developing countries accords importance to establishing a mechanism that not only ensures the effective use of public financing, but also facilitates the mobilization of private financing. Large-scale projects on infrastructure, such as the introduction of facilities with high energy efficiency and the construction of electric power transmission facilities, will require massive investment, and thus leveraging the private financing would be crucially important (this is why Japanese private financing of over USD 3 billion had been mobilized for assistance to developing countries, as of December 2012).

-Mitigation: USD 9.99 billion

Assisting developing countries in such areas as promotion of renewable energy including solar energy, wind energy and geothermal, and introduction of facilities with high energy efficiency, to contribute to reducing GHG emissions.

- Projects for introduction of clean energy by solar electricity generation system (24 countries, 130 million)
- Wind power plant projects (Egypt, 338 million)
- Geothermal power plant projects (13 countries and regions including Kenya, Indonesia and Peru, 979 million)
- Electric transmission projects (Olkaria to Kisumu in Kenya: 108 million, Iringa to Shinyanga in Tanzania: 53 million, Habarana to Veyangoda in Sri Lanka: 83 million)

-Adaptation: USD 1.37 billion

Strengthening developing countries' capability to cope with natural disasters caused by climate change, and providing necessary equipment and facilities to take precaution measures against and to recover from natural disasters including floods and droughts.

- Program for the improvement of capabilities to cope with natural disasters caused by climate change (25 countries, 164 million)
- Infrastructure rehabilitation projects for typhoon damage (Philippines, 86 million)
- Project for flood protection and drainage improvement (Cambodia, 30 million)

- Technical assistance on climate change prediction (South Africa: 1.9 million)
- Capacity building for disaster management in coastal area (Samoa: 6.48 million)
- Rural water supply projects (Ethiopia, Kenya, Djibouti, Sudan, Togo and Malawi: 34 million)
- Desalination project (Tunisia: 8.9 million)

-Mitigation and Adaptation: USD 2.10 billion

Assisting developing countries to tackle climate change issues (both Mitigation and Adaptation) by providing contribution to multilateral fund and program loan to address climate change.

- Contribution to Global Environment Facility (GEF) (96 million)
- Contribution to Climate Investment Funds (CIF) (967 million)
- Climate Change Program Loan (Indonesia and Viet Nam, 410 million)
- Policy dialogue with African countries (in Tokyo, October 2011) and SIDS countries (in Tokyo, July 2012)

-REDD+: USD 723million

Assisting developing countries to conduct survey on forest resources, formulate forest management plan and facilitate forestation by providing necessary equipments in order to promote sustainable use and conservation of forests.

- Forest conservation programs (21 countries, 158 million)
- Contribution to UN-REDD (3.2 million)

The exchange rate is 115JPY/USD.

Each Party shall provide an indication of what new and additional financial resources they have provided, and clarify how they have determined that such resources are new and additional. Please provide this information in relation to table 7(a) and table 7(b).

Documentation Box:**New and Additional Climate Finance**

Japan defines new and additional climate finance as newly committed or disbursed finance which contributes to climate change measures in developing countries.

International assistance for climate change is essential to strengthening momentum for greenhouse gas emission reductions all over the globe, and continues to be a major priority for Japan. Japan seeks new funding from Diet on an annual basis. Our reported climate finance is newly committed or disbursed finance during a given period. In other words, we do not include previously committed or disbursed climate finance.

Documentation Box:**New and Additional Climate Finance**

Japan defines new and additional climate finance as newly committed or disbursed finance which contributes to climate change measures in developing countries.

International assistance for climate change is essential to strengthening momentum for greenhouse gas emission reductions all over the globe, and continues to be a major priority for Japan. Japan seeks new funding from Diet on an annual basis. Our reported climate finance is newly committed or disbursed finance during a given period. In other words, we do not include previously committed or disbursed climate finance.

5.1.3.2. Multilateral Channels

- Cooperation with international organization

- Support for organizing Adaptation Fund Workshop in Africa, Asia and East Europe (Adaptation)

While the Cancun Agreements adopted at COP16 requested Parties to conduct workshops in each region to inform Parties of the process and requirements of the accreditation of National Implementation Agencies which have a direct access to resources of Adaptation Fund, Japan has provided financial support to hold this workshop in Africa, Asia and East Europe.

- Cooperation with UNDP (Adaptation)

In islands states in Oceania and Caribbean Sea, Japan has been providing, in collaboration with UNDP, technical support for managing natural disaster risk and sharing know-how in adaptation to climate change.

- Cooperation with ITTO (Mitigation/Adaptation)

Japan has supported the implementation of ITTO projects to promote conservation and sustainable management of tropical forests, and proper use of tropical forest resources

- Replenishment to GEF (Mitigation/Adaptation)

Japan made a contribution of US \$96 million to the 5th replenishment of the Global Environment Facility (GEF), which is a multilateral financial mechanism to support developing countries' efforts to preserve and improve global environment.

- Contribution to CIF (Mitigation/Adaptation)

Japan also made a contribution of US\$ 967 million to Clean Technology Fund, which supports projects for reducing GHG emissions, and to Strategic Climate Fund, which supports measures such as adaptation against the adverse effects of climate change in developing countries.

^a Parties should fill in a separate table for each year, namely 2011 and 2012, where 2014 is the reporting year.

^b Parties should explain, in their biennial reports, the methodologies used to specify the funds as provided, committed and/or pledged. Parties will provide the information for as many status categories as appropriate in the following order of priority: provided, committed, pledged.

^c Parties may select several applicable sectors. Parties may report sectoral distribution, as applicable, under "Other".

^d This refers to support to multilateral institutions that Parties cannot specify as climate-specific.

^e Parties should explain in their biennial reports how they define funds as being climate-specific.

^f Please specify.

^g Cross-cutting type of support refers to funding for activities which are cross-cutting across mitigation and adaptation.

Custom Footnotes

The unit of JPY is "million Yen". The unit of USD is "million dollars"

The exchange rate is 115 JPY/USD.

It is difficult to quantitatively specify the amount of contributions for climate-specific purpose because whether the funds provided to each institutions are used for climate change related sectors or not depends on the judgement of each institution. Therefore, the amount of contribution for "Climate-specific" are reported as "NE".

2. United Nations Environment Programme	509.48	4.43	NE	NE					
Total	509.48	4.43	NE	NE	Provided	Other (ODA, Other)	Grant	Cross-cutting	Cross-cutting
3. Other									

Abbreviations: ODA = official development assistance, OOF = other official flows.

^a Parties should fill in a separate table for each year, namely 2011 and 2012, where 2014 is the reporting year.

^b Parties should explain, in their biennial reports, the methodologies used to specify the funds as provided, committed and/or pledged. Parties will provide the information for as many status categories as appropriate in the following order of priority: provided, committed, pledged.

^c Parties may select several applicable sectors. Parties may report sectoral distribution, as applicable, under "Other".

^d This refers to support to multilateral institutions that Parties cannot specify as climate-specific.

^e Parties should explain in their biennial reports how they define funds as being climate-specific.

^f Please specify.

^g Cross-cutting type of support refers to funding for activities which are cross-cutting across mitigation and adaptation.

Custom Footnotes

The unit of JPY is "million Yen". The unit of USD is "million dollars"

The exchange rate is 115 JPY/USD.

It is difficult to quantitatively specify the amount of contributions for climate-specific purpose because whether the funds provided to each institutions are used for climate change related sectors or not depends on the judgement of each institution. Therefore, the amount of contribution for "Climate-specific" are reported as "NE".

5.1.3.3. Bilateral and Regional Frameworks Channels

- Grant Aid in bilateral cooperation

- Prevention of Disaster and Rehabilitation (Adaptation)

In 25 countries, Japan provided financial support for the rehabilitation and maintenance of disaster prevention equipment, recovery measures against natural disasters and water supply by groundwater development, as measures taken for adaptation to climate change, including large scale typhoon or cyclone.

In Samoa, as a part of measures against climate change and disaster prevention in Oceania, Japan provided financial support to introduce meteorological observing equipment and communication systems in meteorological bureau and international airport. Besides, in Solomon Islands, Japan provided financial support to improve shortwave radio network to broadcast emergency news related to natural disaster all over the country. In Honduras, Japan constructed land slide prevention facilities such as catchment wells, ditches, earth removal and earth fill and also introduced earth slide monitoring, warning and escaping systems in high risk areas.

In Morocco, where a large number of victims are caused by natural disaster once in several years, Japan has been making efforts to introduce observation and warning devices in river basins and technical supports for activities related to evacuation, in order to reduce damages caused by flood. In Bhutan, Japan provided financial support for reconstruction of the bridges which were damaged by cyclone and vulnerable bridges to be easily damaged by heavy rain in the future.

- Water and Sanitation (Adaptation)

Japan repaired the water supply facilities in the areas which have been suffering from drought caused by climate change. For example, in Ethiopia, Japan constructed and repaired the water supply facilities and provided equipments for reconstructing wells in 10 districts where water supply was extremely poor and underwater development was technically and geologically difficult. In addition, in Sudan Japan improved water supply facilities and implemented plans to supply safe water stably with the residents. Moreover, in Togo, Japan supported the construction of 10 water supply facilities with engine pump as well as constructed 100 water supply facilities with human-powered pump and repaired 50 facilities.

- Introduction of solar power plant (Mitigation)

In 24 countries, Japan contributed to stabilizing electricity supply in developing countries while contributing to reducing GHG emissions, by introducing solar power equipments in the public spaces such as school, airport, water plant and reservoir and thus replacing a part of consuming electricity with renewable energy. In some projects, Japan also provided necessary technical training to manage, maintain and control equipment.

- Forest Conservation (REDD+)

As a measure to contribute to encouraging REDD+ efforts, Japan provided technical support such as analyzing satellite images and financial support for equipment for monitoring and related capacity building in the following actions; preparing forest distribution map, preventing excessive logging, preventing forest fire and taking actions on ensuring alternative energy to firewood in 21 countries.

- Loan support in bilateral cooperation

- Improvement of energy access through the maintenance of electricity transmission equipment (Mitigation)

Japan has been contributing to reducing GHG emissions by electrification of local areas and the improvement of transmission efficiency, while aiming for a transfer to clean energy. In Kenya, Japan built 140 MW geothermal power plants in Olkaria, and supported Olkaria to Kisumu power transmission construction project to enable renewable energy transmission from Olkaria to Kisumu. In Tanzania, Japan has been improving transmission efficiency by expanding a part of the power transmission from Iringa to Shinyanga, in order to stabilize its electricity supply. In Cameroon, Japan has aimed at enhancement of electric power transmission capacity and dissemination of electricity supply to non-electrified areas by constructing electric power substations and electrical line as an electric distribution facilities.

- Introduction of wind power plant (Mitigation)

Japan has been constructing 220 MW wind power plant in Gulf of El Zayt, Red Sea coast, Egypt.

- Introduction of highly efficient power-saving facilities (Mitigation)

In Uzbekistan, Japan introduced highly energy-efficient combined cycle gas turbine to aim at stable electric supply, achieving both emission reduction and economic growth.

- Climate Change Program Loan (Mitigation/Adaptation)

Japan's loan aid is implemented by JICA and one of its characteristic programs is Climate Change Program Loan (CCPL). It helps to develop the multi-year national climate change policy of developing countries, which is called the "policy matrix", based on policy dialogues and supports the activities of private sector to implement those policies. In the process, Japan flexibly coordinates various ODA instruments such as loan aid or technical cooperation. Japan revises the policy matrix by doing monitoring and evaluation every year, and then considers the second and subsequent phase of program loan.

Japan has already signed CCPL agreements with Indonesia and Vietnam, and is now considering introducing it in other countries.

- Technical Assistance in bilateral cooperation

• Prevention of Disaster and Rehabilitation (Adaptation)

In the Republic of South Africa, Japan provided technical support to enhance the functions of meteorological forecasting system, in order to improve the capability of coping with environmental issues such as climate change. In Mozambique, Japan is making efforts to enhance the adaptation capability to climate change, strengthening the basic capability for taking countermeasures against coastal erosion. In Fiji, Japan strengthened the disaster prevention capacity in the local communities to enhance system which enables the residents to escape appropriately in case of flood.

• Water and Sanitation (Adaptation)

In Nigeria, Japan is making efforts to improve local water supply through the capacity building of local staff in charge of water supply and sanitation, in order to better cope with the changes of precipitation pattern caused by climate change. In Burkina Faso, Japan provided technical support to develop, demonstrate water supply and sanitation system which was suitable to that area, as well as to help prepare its introduction.

• NAMA(Mitigation)

Japan supported the capacity building to formulate and implement NAMA in Serbia, Asian countries including Vietnam and African countries.

• Improvement of Energy Efficiency (Mitigation)

In Papua New Guinea, Japan conducted a survey on the current electricity demand and supply and its forecast, as well as a survey on the fuel replacement (from light diesel oil to natural gas) for thermal power plant, the introduction of the cogeneration system, the improvement of energy efficiency (such as heat quantity, transmission) and enlargement of electric-generating capacity, and thus assisted efforts of PNG to reduce GHG emissions.

• Promotion of REDD+ efforts (Mitigation/REDD+)

In Brazil, Japan developed a wide-area assessment technology to evaluate carbon dynamics of various forests in Amazon to promote conservation of functions of forests.

Abbreviations: ODA = official development assistance, OOF = other official flows; USD = United States dollars.

^a Parties should fill in a separate table for each year, namely 2011 and 2012, where 2014 is the reporting year.

^b Parties should report, to the extent possible, on details contained in this table.

^c Parties should explain, in their biennial reports, the methodologies used to specify the funds as provided, committed and/or pledged. Parties will provide the information for as many status

^d Parties may select several applicable sectors. Parties may report sectoral distribution, as applicable, under "Other".

^e Parties should report, as appropriate, on project details and the implementing agency.

^f Parties should explain in their biennial reports how they define funds as being climate-specific.

^g Please specify.

^h Cross-cutting type of support refers to funding for activities which are cross-cutting across mitigation and adaptation.

Custom Footnotes

The unit of JPY is "million Japanese Yen", and the unit of USD is "million US dollars".

The exchange rate is 115JPY/USD.

5.1.3.4. Private Finance

In order to further promote climate change action, Japan has also been working on establishing a mechanism to leverage private investment by use of public finance. Co-financing by JBIC with private sector and trade insurance are the examples of utilizing private finance. Private Finance also plays an important role to tackle climate change as its total amount is over 3 billion dollars as of December 2012, although it is not counted as Japan's Fast-Start Finance in this document.

- Other Official Flow, including co-funding with private sector

- Global Action for Reconciling Economic Growth and Environmental Preservation by JBIC (GREEN)(Mitigation)

In April 2010, JBIC launched a new operation named 'GREEN' (Global action for Reconciling Economic growth and Environmental preservation) of which primary purpose is to support projects with favorable impact on the preservation of the global environment. Under the 'GREEN' operation, JBIC utilizes its untied facility (loans and guarantees) and equity participation while mobilizing private funds.

<Features>

In every project under the 'GREEN' operation, JBIC conducts its own accounting measures named 'J-MRV Guidelines' for reduction impact of GHG emission. It is based on the idea that such accounting makes borrowers strongly aware of their contribution to the preservation of the global environment through the relevant projects.

<Examples>

JBIC has provided finance needed for the environment-related loans (improving energy efficiency project or renewable energy project) to financial institutions, such as Deniz Bank in Turkey, Corporacion Andina de Fomento in Latin America, BNDES in Brazil and ICICI Bank in India. Through this operation, the funding of JBIC enabled private finance institutions to co-finance, which led to the mobilization of more fund.

5.2. Technology development and transfer

Japan will contribute to solve the climate change problem all over the globe through the development of technologies of environment and energy fields (Innovation), and taking a leadership on international diffusion of the technologies (Application) based on the proactive diplomatic initiatives for countering global warming which is called “Actions for Cool Earth Japan” which was announced in November 2013.

5.2.1. Innovation

The government promotes diffusion of technological innovation and ensure

- Expanding Domestic Investment

On the premise of achieving primary balance surpluses in national and local government finances by FY2020, both private and public sectors will domestically invest combined \$110billion for technological innovation over five years. In particular, from a long-term perspective, the government will take the initiative in developing technologies in areas where risks are high, but anticipated impact is large.

- Formulating Technology Roadmap

“Low Carbon Technology Plan” was revised to include a technology roadmap indicating targeted technology levels based on the latest scientific knowledge. Japan will steadily implement this plan and globally cooperate to develop and diffuse the technologies to cover approximately 80 percent of the reductions needed to halve global emissions by 2050.

- International Cooperation on Research and Development

The government will accelerate global development of innovative technologies by promoting international cooperation with major countries with a focus on basic research. To tackle global warming issues through accelerated innovation, Japan will annually host “Innovation for Cool Earth Forum”, a kind of energy-and-environment-version of Davos Forum, with the participation of leaders of industry, government, and academia.

5.2.2. Emissions Reduction in Oversea Countries by Diffusing Technologies

Japan will promote the global “application” of existing low-carbon technologies. Accelerating the diffusion of such technologies and verifying the reduction effect by the technologies will realize the further emission reduction of greenhouse gasses and new economic growth simultaneously.

5.2.2.1. Joint Crediting Mechanism (JCM)

Japan is promoting the establishment and implementation of the “Joint Crediting Mechanism

(JCM)” in which Japan facilitates the diffusion of advanced low carbon technologies, products, systems, services, and infrastructure as well as implementation of mitigation actions, and contributes to sustainable development of developing countries. Following an appropriate evaluation of the contributions to GHG emission reductions or removals in developing countries in a quantitative manner, Japan will use them to achieve its emission reduction target.

Since Japan and Mongolia signed bilateral documents in January 2013 for the first time to start this mechanism, the number of partner countries has increased to 9 as of December 2013. The government aims to increase the number to 16 in 3 years and, to achieve the target, is accelerating the discussions with developing countries. At the same time, Japan is promoting the formulation of JCM projects through various supporting schemes, and further accelerating the transfer of low-carbon technologies.

5.2.2.2. Development of the Basic Framework to Diffuse Technologies

- Support for International Standardization and Institutional Arrangement

The government has contributed to the international standardization of measuring CO₂ emissions through steel processing and effects of energy saving of air-conditioners with inverters. The government will also propose assessing measures of energy efficiencies of LED lightings etc. thus will contribute to the international standardization onwards. In addition, the government will provide supports on institutional arrangements for enhancing abilities of appropriate measuring and developing standards of energy savings in developing countries.

- Support for Formulating Low-Carbon Strategies and Enhancing Adaptive Ability in Developing Countries with Technologies and Know-How of Japan

- Utilization of Satellites

The government aims to launch a new state-of-the-art GHG observing satellite (successor to GOSAT) in FY2017. Focusing on Asia, the satellite will monitor nation-by-nation or megacity-by-megacity GHG emission levels, verify the effectiveness of countermeasures and propose emission reduction measures.

- Assessments

Technological needs will be identified and the direction of technology creation and diffusion will be effectively verified based on verification of the effectiveness of the introduced low-carbon technologies and technology assessment (assessment of utility and environmental impact of technologies).

5.2.2.3. Other supports for developing countries

In developing countries in particular, addressing deforestation and forest degradation due to illegal logging, expanding agricultural land and other factors are urgent issues. Leveraging its

knowledge and expertise, Japan will actively support Reducing Emissions from Deforestation and Forest Degradation (REDD+) including sustainable management of forests in developing countries, which will contribute to forest conservation in those countries.

In addition, at the United Nations Conference on Sustainable Development (Rio+20) in June 2012, Japan announced that over the following three-year period it would provide US \$3 billion in support to developing countries for renewable energy and other initiatives in the climate change field. And Japan also announced it would boost the training and development of human resources for the green economy transition by organizing 10,000 experts over the same three-year period.

Furthermore, in order to achieve compatibility between environmental protection and economic growth in developing countries, Japan will promote cooperation through a co-benefits approach that will contribute to both environmental pollution reduction and greenhouse gas emissions reduction, which is a global concern.

By supporting activities by the Asia Pacific Adaptation Network (APAN) and other networks, Japan will share information, knowledge and experience within the Asia-Pacific region with the aim of strengthening its adaptive capacity toward climate change.

Information on Japan's project on the provision of assistance for the development and transfer of technology is as shown in Table 5-7.

Table 5-7 Provision of technology development and transfer support (CTF Table 8)

Measures and activities related to technology transfer	Recipient country and/or region	Targeted area	Sector	Purpose	Total funding	Years in operation	Description	Technology transferred	Indicate factors which led to project's success	Source of the funding for technology transfer	Activities undertaken by	Status	Impact on greenhouse gas emissions/sinks	Additional information
Demonstration Project of technology and System for International Energy Consumption Efficiency	Global	Mitigation	Energy	Contribute to the solutions of problems in terms of the mitigation of tight energy supply and demand in the world, energy security in Japan and measures to global warming by the dissemination of Japanese superior technology	18920 (included 980 for clean coal technology projects)	1993	Customize Japanese superior technologies such as energy saving, renewable energy and smart community technology flexibly in accordance with natural condition, regulatory and system, and industrial structure of targeted country, and visualize the advantages and effectiveness of them.	Energy saving, Renewable Energy, Smart Community technology, clean coal technology	-	Private and Public	Private and Public	Implemented	Approx. 34.82 Mt-CO2/year	
Project for development of the Meteorological Radar System in the Philippines	Philippines	Adaptation	Prevention and restoration of disaster	Develop the Meteorological Radar System and peripheral equipments, and support the monitoring of typhoon	3350	2009	Put in the place meteorological monitoring equipments and three weather radar facilities of Virac, Aparri and Guuan, and support the typhoon monitoring with Japanese technologies.	Meteorological Radar System and meteorological monitoring equipment		Public	Private and Public	Planned	-	
Desalination plan of groundwater in Southern Region of Tunisia	Tunisia	Adaptation	Water and Sanitation	Improve access to drinking water in Medenine Governorate in Southern Region of Tunisia	1000	2010	Because of increase of water consumption and expansion of water supply area, drinking water cannot be supplied adequately in southern region of Tunisia. In addition, it is concerned that the securing of drinking water will be more difficult because decreasing in precipitation and worsening of groundwater salination in coastal areas are expected to become advanced due to climate change. Therefore, Japan supports the development of groundwater desalination system by a reverse osmosis membrane to improve access to drinking water in Medenine Governorate in southern region of Tunisia	Groundwater desalination system by a reverse osmosis membrane		Private	Private and Public	Implemented	-	
Project for Total Emission Control of Nitrogen Oxide in Atmosphere in China	China	Mitigation	Industry	Improve methods to control increasing NOx emissions in China which shows rapid economic growth	63	2013	Implement the preparation for installation of NOx emission control technology to facilities and prepare a technical guidelines. In addition, accept the trainees and verify the method to grasp NOx control effect through the simulation technique for air pollutants dispersion model.	Japanese technologies to control emission of NOx which is indirect GHGs		Public	Private and Public	Planned	-	
Project for impact assessment of Climate Change in Brantas and Musi River and integrating into the Water Resources Management Plans	Indonesia	Adaptation	Water and Sanitation	Perform the impact assessing of Climate Change in Brantas and Musi River and integrate it into the Water Resources Management Plans	134	2013	Prepare climate change prediction data and re-assess the safety and flood control level based on the result of the data, and develop Mitigation and Adaptation strategies for climate change. In addition, prepare an guideline applicable to another region.	Reassessment of the safety of water control and utilization based on the preparation and results of climate change prediction data using Japanese technology, and develop a mitigation and adaptation strategies for climate change in the target river basin		Public	Private and Public	Planned	-	

Chapter 5 Provision of financial technological and capacity-building support to developing country Parties

Measures and activities related to technology transfer	Recipient country and/or region	Targeted area	Sector	Purpose	Total funding	Years in operation	Description	Technology transferred	Indicate factors which led to project's success	Source of the funding for technology transfer	Activities undertaken by	Status	Impact on greenhouse gas emissions/sinks	Additional information
CTI Private Financing Advisory Network(CTI PFAN) Program (AFCEF3)	Asia/Pacific	Mitigation	Energy	Improve the possibility of financing mainly by the private sector, providing advice and technical assistance for the project developer in developing countries or economies in transition, and improving project proposals to the level which international finance requests.	14	2012	Hold seminars for enhancing fund-raising capacities of the developers of clean-energy projects in developing countries and forums for introducing them to the investors for providing opportunities for matching between developers and investors.	Renewable energy technologies (Biomass, Biogas, Hydropower, Solar power)		Private and Public	Private	Implemented	2.91 Mt-CO2/year	
CTI Private Financing Advisory Network(CTI PFAN) Program (AFCEF1,2)	Africa	Mitigation	Energy	Improve the possibility of financing mainly by the private sector, providing advice and technical assistance for the project developer in developing countries or economies in transition, and improving project proposals to the level which international finance requests.	29	2010	Hold seminars for enhancing fund-raising capacities of the developers of clean-energy projects in developing countries and forums for introducing them to the investors for providing opportunities for matching between developers and investors.	Renewable energy technologies (Biomass, Biogas, Hydropower, Solar power)	Provide individualized teaching to project developers, and hold the seminars for introducing them to the investors and matching between developers and investors	Private and Public	Private	Implemented	Approx. 0.94 Mt-CO2/year	GHG emission reduction is not achieved by only Japanese contribution because this GHG emission reduction was result from the project established under CTI-PFAN which was a multilateral public-private partnership.
Greenhouse gas emission reduction support project	Asia/Pacific	Mitigation	Energy	Reduce energy use and GHG emissions in industry sector of developing countries by promoting technology transfer and dissemination of Japanese superior energy-saving technologies and products for the industry sector of developing countries	92	2010	Send Japanese experts to model companies in India, Philippines and China, and provide energy-saving consulting and technical guidance. Also, conduct capacity building activities including holding of seminars for dissemination of technologies and individualized teaching for staff at local companies and relevant government staff in order to promote the spontaneous dissemination of the energy-saving technologies mainly developed by the model companies.	Energy-saving technology	Provide the energy-saving consulting and the technical guidance to rolling mills in India, food factories and commercial buildings in Philippines and chemical fertilizer factories in China. Hold the seminars and workshops for disseminating improvement of energy-saving activities	Private and Public	Private	Planned	Approx. 0.535 Mt-CO2/year	
Global environment international cooperation project	Asia/Pacific	Mitigation	Energy	Promote transfer and dissemination of Japanese superior climate change protection technology and products to developing countries and emerging economies by providing support individually to small and medium-sized enterprises in Japan that would like to sell their climate change protection technology to developing countries and emerging economies.	8	2012	Provide support individually including introduction of local companies with needs, coordinate support of local activities and provision of consulting service in local area for the Japanese companies interested in transfer of their technologies to companies and local governments in Thailand and Philippines.	Renewable energy technologies (Electric generation by biogas, Biogasification)	Provide service by local consultants as one of support	Private and Public	Private	Planned	Approx. 6 kt-CO2/year	

Measures and activities related to technology transfer	Recipient country and/or region	Targeted area	Sector	Purpose	Total funding	Years in operation	Description	Technology transferred	Indicate factors which led to project's success	Source of the funding for technology transfer	Activities undertaken by	Status	Impact on greenhouse gas emissions/sinks	Additional information
Global Superior Energy Performance Partnership : GSEP	Global	Mitigation	Energy, Industry	Ensure energy security and promote global warming measures through development, dissemination and transfer of energy-saving and environment-friendly technology, and technological cooperation of associated technology under the public-private partnership	59	2010	Under GSEP sectoral working groups chaired by Japan (Power WG, Steel WG, Cement WG), inherit activities of Cement TF, Power generation and Transmission TF, and Steel TF under Asia-Pacific Partnership on Clean Development and Climate (APP), and promote the activities relevant to the development, dissemination and transfer of the most advanced technologies for high-efficiency and low-emission by sector under the cooperation between the public and private sectors.	Technologies for operation and maintenance contributory to the maintenance and enhancement of thermal efficiency of coal power generation plants	Share the technologies and know-how for the improvement and maintenance of thermal efficiency of coal power plants through equipment diagnosis and information exchange about operation and maintenance of coal power plant.	Private and Public	Private and Public	Implemented		
Project for promoting new system of measures against illegal logging of tropical forest	Peru, Indonesia, Togo	Mitigation	Forestry	Promote efficient and effective measures against illegal logging of tropical forests	72	2012	*Enhance the traceability capacity of small and medium-sized enterprises which ensure sustainable and legitimate timber production and processing. *Restore degraded forests by provision of local nursery trees and forestation. *Put in place map information systems such as the development of forest information and GIS.	Improvement of forest functions for traceability of wood and restoration of degraded forests, and development of the map information systems.	Hold several training workshops on the operation of the relevant technologies for the counterparts	Public	Public	Implemented		
Project for promoting measures against illegal logging to prevent deforestation and rain forest degradation	Philippines, Guatemala, etc.	Mitigation	Forestry	Promote efficient and effective measures against illegal logging of tropical forests	229	2010, 2011	*Develop the certification systems for the legality and sustainability of forest resources by the enhancement of information such as CoC certification, the certification of legality and area of production. *Develop the continuous forest information systems in using GIS, develop the packages of technical data necessary for decision-making, and conduct the dissemination and promotion strategies relevant to SIFGUA.	Operation system of Forest Stock Monitoring System (FSMS) and productivity information system	Hold several training workshops on the operation of the relevant technologies for the counterparts	Public	Public	Implemented		
Project for promoting prevention of deforestation and forest degradation in developing countries	Asia/Pacific	Mitigation	Forestry	Develop a system to grasp the deforestation and forest degradation quantitatively to take adequate measures for reducing deforestation and forest degradation by developing countries themselves.	150	2009	Training of personnel with expertise on monitoring forest deforestation and degradation by utilizing satellite images, understanding factors, and future prediction	Monitoring technologies for deforestation and forest degradation	Hold the workshops on the results of monitoring technologies on deforestation and forest degradation for the relevant persons in developing countries	Public	Private	Implemented		

Measures and activities related to technology transfer	Recipient country and/or region	Targeted area	Sector	Purpose	Total funding	Years in operation	Description	Technology transferred	Indicate factors which led to project's success	Source of the funding for technology transfer	Activities undertaken by	Status	Impact on greenhouse gas emissions/sinks	Additional information
Project for promoting sustainable forest management in developing countries	Africa	Mitigation	Forestry	Promote overseas forest conservation activities by various actors such as enterprises and NGOs.	288	2009, 2010	<ul style="list-style-type: none"> Develop and disseminate methodologies for selecting candidate sites for forestation and recovery of green land considering the water balance in half-dry areas. Develop and disseminate technical guidelines for the forest development and management which can contribute to the poverty reduction in developing countries and revegetation such as the land after mines. 	Methodologies for the forest development and management in half-dry area, and technologies for the forest development and management, and revegetation in the land after development	Hold the trainings and workshops on the results including methodologies developed for the relevant persons in developing countries	Public	Private	Implemented		
Program for supporting process of United Nations forests forum	Asia/Pacific	Mitigation	Forestry	Support the reporting of progress of sustainable forest management by developing countries to United Nation Forest Forum (UNFF)	120	2011	Identify and develop methodologies for data collection and reporting which contribute to the reporting to UNFF, and develop human resources for the enhancement of reporting capacities in each country so that developing countries can deal with the activities which are to report their progress of the activities for the sustainable forest management by using standard and index for the sustainable forest management.	Identification and development of methodologies for reporting and data collection which can contribute to the preparation of national reports reported to UNFF	Hold the local workshops on the transfer of relevant technologies, and transfer the technologies to relevant countries	Public	Public	Implemented		

5.3. Capacity-building

To overcome the problems of climate change, not only industrialised countries but all countries including developing countries should participate in mitigation actions to curb emissions of GHG. Many developing countries, however, do not have enough human resource and technical capacity to effectively conduct climate change policies as well as the lack of institutional arrangements.

Therefore, Japan actively conducts projects to enhance their capacity with taking advantage of our low-carbon technologies, know-how, and experiences of developing low-carbon society in Japan to leverage the progress of global climate change actions.

The detailed information of projects/programmes to promote capacity building in developing countries is as follows.

Table 5-8 Provision of capacity-building support (CTF Table 9)

Programme or project title	Recipient country / region	Targeted area	Description of programme or project
Project to support the large-scale formation of Joint Crediting Mechanism programs to realize Low Carbon Societies in Asia	Asia/Pacific and SIDS	Mitigation	<ul style="list-style-type: none"> Formulate large-scaled projects with utilizing JCM (Joint Crediting Mechanism) and hold workshops for the policy makers of host countries to promote low carbonization of cities and regions in Asia. Prepare the NAMAs Guidebook for developing countries and MRV handbook for implementing JCM. Invite interested persons of countries and cities to Japan and hold seminar to promote partnerships between cities to promote the construction of low carbon society, and share information on Japanese advanced environmental technologies between interested persons.
Asia-Pacific joint research/observation work of the Global Environment	Asia/Pacific	Multiple Areas	Supports the Asia-Pacific Network for Global Change Research (APN) which is an intergovernmental network in the Asia-Pacific region to foster global change research, increase developing country participation in that research, and strengthen interactions between the science community and policy-makers.
Asia-Pacific Regional Assessment of the Climate Change Impacts and Promotion of Adaptation	Asia/Pacific	Adaptation	Supports UNEP lead the Asia-Pacific Adaptation Network (APAN), under the Global Adaptation Network (GAN), to enhance capacity of policy-makers and practitioners in the Asia-Pacific region by sharing knowledge on climate change adaptation.
International Research Network for Low Carbon Societies	Asia/Pacific	Mitigation	Supports the International Research Network for Low Carbon Societies in Asia to develop capacity of researchers and others for building low carbon societies.
Asia-Pacific Seminar on Climate Change	Asia/Pacific	Multiple Areas	Every year since 1991, the Ministry of the Environment, Japan has been convening the Asia-Pacific Seminar on Climate Change which has served as an important vehicle for countries in the region to exchange views and information on their respective efforts to mitigate and adapt to climate change in a practical manner, thereby contributing to capacity and confidence building among them.
Acid Deposition Monitoring Network in East Asia	Asia/Pacific	Technological development/transfer	EANET started in 1998 as an intergovernmental initiative to create a common understanding on the state of acid deposition problems in East Asia, provide useful inputs for decision making at various levels with the aim of preventing or reducing the adverse impacts on the environment, and promote cooperation among countries. Thirteen countries in East Asia are participating in EANET at present.
Japan-South Africa water resources management workshop	South Africa	Adaptation	Hold workshops on Japanese activities related to water resource management through introducing adaptation to climate change, maintenance and management of infrastructure and activities for water quality improvement.

Programme or project title	Recipient country / region	Targeted area	Description of programme or project
Activities under "Memorandum of Cooperation Flood control and Adaptation of Climate change" executed between Ministry of Land, Infrastructure and Transportation (MLIT) Japan and Ministry of Agriculture and Rural Development (MARD) Vietnam	Vietnam	Adaptation	Hold workshops to provide case study of Japanese flood control measures based on the memorandum.
Japan Practical Guidelines on Strategic Climate Change Adaptation Planning - Flood Disasters -	Asia/Pacific	Adaptation	Develop a guideline including basic procedures for developing adaptation measures to damage of floods which become increasingly severe by climate change and publish it on the web for Asia and Pacific regions. This manual is based on experiences, strategies and technologies accumulated in Japan over the years.
Flood forecasting utilizing satellite data etc	Asia/Pacific, Middle East	Adaptation	Make available Integrated Flood Analysis System (IFAS) utilizing satellite developed by International Center for Water Hazard and Risk Management (ICHARM) for free of charge via the internet, and execute seminars about the use of IFAS specifically designed to officials of the government in Indonesia, Philippines, Myanmar, Vietnam and Iran.
Various trainings on the flood control measures for countering the effects of climate change	Asia/Pacific Africa Middle East/North Africa Latin America and the Caribbean	Adaptation	Provide various trainings on the flood control measures for countering the effects of climate change to officials of the government in developing countries that are facing with flood damages in collaboration with the Japan International Cooperation Agency (JICA) and the National Graduate Institute for Policy Studies (GRIPS).
The 5th International Conference on Flood Management	Global	Adaptation	ICHARM, ICFM5 Secretariat organized the 5th International Conference on Flood Management from 27 to 29 September 2011. More than 450 participants participated on some sessions and verbal presentations on realistic methods for adaptation to climate change.
Research project for developing infrastructure for obtaining Joint Credit (Human resource development related to MRV)	India, Vietnam, Mongolia, South Africa	Mitigation	Provide the following training and expert sending for the purpose of disseminating Japanese low carbon technologies and products for countries which have agreed Joint Crediting Mechanism (JCM) and are possible to agree to develop system of JCM in accordance with the situation of international negotiation of Japanese government. - Accept trainee such as decision makers of business, engineer and policy makers from partner countries, and provide training including seminar on MRV and low carbon technology and products, study tour of facilities and introduction of technology. - Send experts to partner countries, and provide training including seminar on MRV and low carbon technology and products, and lecture on technology for decision makers of business, engineer and policy makers.
Project for rationalization of international energy use	Asia/Pacific, Middle East/North Africa, Africa, Latin America and the Caribbean	Mitigation	Mitigate the shortage of international energy demand by promoting the introduction of energy conservation measures and renewable energy in foreign countries through institutional building support by the project of accepting trainees and dispatching experts.
Project for promoting new systems of measures against illegal logging of tropical forest	Peru, Indonesia, Togo	Mitigation	<ul style="list-style-type: none"> • Enhance the traceability capacity of small and medium-sized enterprises, which ensures sustainable and legitimate timber production and processing. • Providing and planting nursery trees of native tree species • Systematizing information in forest sector and improving reliability through the development of human resources to perform the maintenance of the information on forest and GIS
Project for promoting measures against illegal logging to prevent deforestation and rain forest degradation	Philippines, Guatemala, etc.	Mitigation	<ul style="list-style-type: none"> • Institutional improvements and human resources development such as amplifying information of CoC certification, legality and proof of origin • Development of human resources in accordance with the continuous building forest information system using such as GIS and the development of technical data package necessary for decision-making

Programme or project title	Recipient country / region	Targeted area	Description of programme or project
Project for promoting prevention of deforestation and forest degradation in developing countries	Asia/Pacific	Mitigation	Training of personnel for expertise in monitoring deforestation and forest degradation by using satellite images, identifying drivers of deforestation and forest degradation, and estimation of future forest cover change
Project for promoting sustainable forest management in developing countries	Africa	Mitigation	Organize workshops and training for stakeholders in order to develop measures for forestation and forest management for promoting sustainable forest management in developing countries
Caribbean Disaster Management Project	Latin America and the Caribbean	Adaptation	Build capacity and strengthen institutional mechanisms to mitigate dangers in the Caribbean Disaster Emergency Response Agency (CDERA) participating states, particularly regarding flood hazards.
Developing countermeasures against landslide	Ethiopia	Adaptation	Enhance capacity for adaptation to heavy rain affected by climate change through developing disaster reduction capacity, implementing inspections and analyzing the landslide generation mechanism in the Abai Valley in Ethiopia.
Expert on disaster prevention	Guatemala	Adaptation	Enhance capacity for adaptation to climate change by developing disaster reduction policy making capacity in Guatemala.
Disaster management capacity enhancement project adaptable to climate change	Sri Lanka	Adaptation	Enhance capacity for adaptation to climate change through developing disaster reduction capacity by establishing a disaster reduction framework model that includes disaster observation and forecasting, disaster reduction activity and evacuation of residences.
Training for the countermeasures against littoral erosion	Senegal	Adaptation	Plan and establish effective countermeasures for shore erosion.
Capacity development for disaster management	Thailand	Adaptation	Enhance climate change adaptation capacity by developing DDFPM's capacity for diffusing disaster reduction activities, community disaster reduction and school education on disaster reduction.
Strengthening Community Disaster Risk Management Project in the Pacific Region	Fiji	Adaptation	Enhance an appropriate framework for appropriate evacuation when flooding occurs outside targeted areas.
Disaster Risk Management	Philippines	Adaptation	Enhance disaster reduction capacity at NDRRMC-OCD in the Philippines.
Project for Building Disaster Resilient Societies in Vietnam (Phase 2)	Vietnam	Adaptation	Develop capacity for adaptation to climate change, especially water-related disasters, by implementing structural and non-structural measures at the central and local levels.
Project on Capacity Development for Disaster Risk Management in Central America "Bosai", Phase 2	North, Central and South America	Adaptation	Establish a sustainable framework for diffusing community disaster reduction in accordance with the PCGIR, which was determined as a regional activity for natural disaster risk reduction and prevention of natural disaster risks.
Groundwater Development and Management Capacity Development Project in Tanzania	Tanzania	Adaptation	Enhance capacity for groundwater development in government cooperation or by the private sector of wells and dams in order to implement one of the components of the national water development program, the "water supply and sanitation" program.
Advisor on water resources policy	Indonesia	Adaptation	Develop capacity for studying measures in response to variation of precipitation patterns, promoting integrated water resource management in Indonesia.
Project for water management improvement	Uzbekistan	Adaptation	Enhance capacity to address precipitation pattern change affected by climate change through developing WUA water management methods in the region under the jurisdiction of BISM.

Programme or project title	Recipient country / region	Targeted area	Description of programme or project
Project for management of non-revenue water	Kenya	Adaptation	Enhance capacity to address precipitation pattern change affected by climate change through promoting the effective use of water resources by implementing a reduction in the proportion of non-revenue water in Kenya.
Training for water resources and environmental management	Singapore	Adaptation	Enhance capacity to address precipitation pattern change affected by climate change through promoting effective water utilization via non-traditional water resource and environment control knowledge and technology in water-poor areas.
Project for enhancing the function of the national water resources institute	Nigeria	Adaptation	Enhance capacity to address precipitation pattern change affected by climate change through developing capacity of local water supply and health staff by improving water supply services.
Project on Effective Utilization of Reservoirs and Auto-Promotion of Local Communities in the Sahel	Niger	Adaptation	Promote sustainable village development and alleviate the vulnerability of farm production to decreasing precipitation through organized capacity development for diffusion staff for the effective utilization of reservoirs in Tahoua Region and Maradi Region.
Training for water supply system	Bangladesh	Adaptation	Enhance capacity to address precipitation pattern change affected by climate change by promoting a clean water supply system in Khulna city.
Improving sustainable water and sanitation system	Burkina Faso	Adaptation	Enhance capacity to address precipitation pattern change affected by climate change by promoting development, verification and preparation for a water and sanitation system appropriate for the African Sahel
Advisor on water sector	Mexico	Adaptation	Enhance capacity to address precipitation pattern change affected by climate change by promoting effective utilization of water and developing capacity for water quality conservation in CONAGUA.
Enhancement of Water Resources Management in Haouz Plain	Morocco	Adaptation	Enhance capacity to address precipitation pattern change affected by climate change by developing administrative capacity for water resource management in ABHT.
Capacity Development Project on Nationally Appropriate Mitigation Actions (NAMAs)	Serbia	Mitigation	Develop capacity for planning nationally appropriate mitigation actions.
Project for Capacity Development for the National Focal Point on Climate Change to Enhance the Implementation of Climate Change Policies in Indonesia	Indonesia	Mitigation	Develop the DNPI's institutional capacity to coordinate and evaluate climate change policy as a focal point on climate change.
Capacity Development and Institutional Strengthening for GHG Mitigation	Thailand	Mitigation	Develop capacity and strengthen institutional power for GHG mitigation.
Project for Capacity Building for National Greenhouse Gas Inventory	Vietnam	Mitigation	Develop capacity to compile periodic national GHG inventories which have time-series consistent, accurate and a clear estimation method for GHG emissions and removals.
Project for Development of Low Carbon Society Scenarios for Asian Regions	Malaysia	Mitigation	Develop and apply a structural method for a low carbon society scenario and dispatch the results in the Asian region.
Capacity Development for NAMA/MRV	Africa , Asia	Mitigation	Develop capacity to make NAMAs and understand international trends, concrete policies, and effective measures and measurement methods of GHG gas reduction.
Strengthening capacity of electric power pool in Eastern and Southern Africa	Africa	Mitigation	Strengthen capacity of electric power pool by establishing a solution policy for electricity shortages and improving energy efficiency in Eastern and Southern Africa.
Promotion of cleaner production	Argentina	Mitigation	Promote diffusion of cleaner production technology, mainly energy saving technology, particularly held in small- and medium-sized companies.
Training for mass rapid transit	Indonesia	Mitigation	Improve civic facilities and the urban environment by reducing traffic pollution by reinforcing mass rapid transit.
The training for promotion of energy efficiency and conservation	Serbia	Mitigation	Make an action plan in order to establish an energy management institution in Serbia through utilizing information collected by Japanese energy management institutions.
Workshop on Promotion of Energy Efficiency for Black Sea Economic Cooperation (BSEC) Countries	Turkey	Mitigation	Promote energy saving policy through a workshop on the Promotion of Energy Efficiency for the Black Sea Economic Cooperation (BSEC) countries.
Power Sector Adviser	Bangladesh	Mitigation	Support reform of the electric power sector and improve efficiency in electric facilities.
Training program on smart grid/smart community in Brazil	Brazil	Mitigation	Strengthen recognition and initiative for smart grid/smart community introduction and promote smart grid/smart community enterprises through Japanese technology in Brazil.

Programme or project title	Recipient country / region	Targeted area	Description of programme or project
Expert on demand-side management and energy conservation	Maldives	Mitigation	Establish institutions and develop capacity for promoting Demand Side Management (DSM) and energy saving.
Expert for Urban Transportation System Improvement in Ulaanbaatar city, Mongolia	Mongolia	Mitigation	Promote deployment and control capacity of irrigation facilities, promote water management capacity and strengthen water usage alliance for Ministry of Food, Agriculture and Light Industry in Mongolia.
Project for RECO's Capacity Building for Efficient Power System Development	Rwanda	Mitigation	Develop efficiency and stability of the electric power system.
Project for Strengthening National Forest Resources Monitoring System for Promoting Sustainable Forest Management and REDD+ in the Democratic Republic of the Congo	Democratic Republic of the Congo	Mitigation	Promote REDD+ by implementing natural forest monitoring appropriately based on the operating plan of the national forest resource inventory system.
Capacity Development on Forest Resource Monitoring for Addressing Climate Change in Papua New Guinea	Papua New Guinea	Mitigation	Conserve and manage sustainable forestland in PNG as an important climate mitigation and adaptation measure.
Training on mitigating climate change through social forestry	Kenya	Mitigation	Implement countermeasures against climate change through social forestry in order to develop capacity in training on mitigating climate change.
Research on reforestation for reducing GHGs	Tajikistan	Mitigation	Propose forest preservation and reforestation in pilot area in order to reduce GHGs, preserve forest and conduct reforestation.
Afforestation Planning and Implementation Capacity Strengthening Project	Vietnam	Mitigation	Develop afforestation planning capacity of people related to the forest industry to mitigate GHGs through CO2 absorption and soil conservation.
Human resource development on forestry	China	Mitigation	Promote forest preservation through training for the forest industry to promote reform in the industry in western China.
Development of a System of National Forest Resources Inventory contributing to national REDD activities	Gabon	Mitigation	1. Promote maintenance, management and solid policy for forest resources in accordance with the REDD framework. 2. Realize a periodic resource evaluation framework and promote forest resource management. 3. Support REDD related policy. 4. Promote management by people who benefit from forest resources. 5. Strengthen the exchange of forest policy information among countries in the Congo Basin.
Advisor: Sustainable Forest Management in the Congo Basin	Cameroon	Mitigation	Promote sustainable forest management in the COMIFAC (Central African Forest Commission) countries.
Project for Facilitating the Implementation of REDD+ Strategy and Policy	Cambodia	Mitigation	Promote sustainable forest management as climate change mitigation based on the experience of REDD+ strategy and policy.
