

The Exposure to chemical compounds in the Japanese People

- Survey of the Exposure
to chemical compounds
in Human (2011 ~) -

2016

Environmental Risk Assessment Office,
Environmental Health Department,
Ministry of the Environment, Japan

Introduction

The Environmental Risk Assessment Office, Environmental Health Department, Ministry of the Environment, Japan (MOE) has been conducting a survey titled "Survey of the Exposure to Dioxins and other chemical compounds in Humans" to determine the exposure and accumulation levels of chemical compounds in Japanese subjects in FY 2011, and "Survey of the Exposure to chemical compounds in Humans" since FY 2012.

The Environmental Risk Assessment Office has now compiled 5 years of survey results conducted during FY 2011–2015.

Summary of "Survey of the Exposure to chemical compounds in Humans"

Survey objectives

- Grasp accumulated levels of dioxins and other chemical compounds in Japanese people.
- Conduct a follow-up survey to observe chronological changes in the accumulation levels of chemical compounds in the previous participants.
- Conduct a monitoring survey of Persistent Organic Pollutants (POPs) in biological samples required by the Stockholm Convention.

Scope and methods of the survey

- Three areas per year selected from the survey regions in "Survey on the accumulation of dioxins and other chemical compounds in humans" conducted during FY 2002–2010.
- Within each survey area, 80 residents who were 40–59 at the time of the survey and who had lived in the area for a long period were recruited as survey subjects each year.
- Dioxins and other chemical compounds were measured in the blood and urine of the survey subjects.
- Food samples were collected over a three-day period from 15 survey subjects each fiscal year. The concentrations of chemical compounds in food were measured for calculating the intakes.
- A survey on the lifestyle of the subjects was conducted based on questionnaire.

Results from the dioxins survey

- For the 410 people who had their blood measured for dioxins in their blood, the average was 11 pg-TEQ/g-fat, with a range of 0.39–56 pg-TEQ/g-fat. Dioxin levels decreased in the blood of 73 out of 77 people who had participated in "Survey of the Exposure to Dioxins and other chemical compounds in Humans" conducted from FY 2002 to 2007 (6–9 years from previous study).
- For the 75 people who had their food measured for dioxin intakes from food, the average was 0.50 pg-TEQ/kg body weight/day with a range of 0.035–2.4 pg-TEQ/kg body weight/day. No survey subjects exceeded the tolerable daily intake (TDI) of 4 pg-TEQ/kg body weight/day.

Results from the organic fluorine compounds survey

- For the 326 people who had their blood measured for organic fluorine compounds, the PFOS average was 4.3 ng/ml with a range of 0.29-17 ng/mL, and the PFOA average was 2.4 ng/mL with a range of 0.27-13 ng/mL. These results were within the range of surveys conducted from FY 2008 to 2010 are similar to those reported in other surveys.
- For the 15 people who had their food measured for organic fluorine compounds intakes from food, the PFOS average was 0.57 ng/kg body weight/day with a range of N.D.-1.7 ng/kg body weight/day, and the PFOA average was 0.69 ng/kg body weight/day with a range of N.D.-2.9 ng/kg body weight/day.

Results from the metals survey

- As metals within blood, total mercury, lead, cadmium, total arsenic, copper, selenium, zinc, and manganese were measured. The median value of 410 people who had total mercury measured in their blood was 8.3 ng/mL, with a range of 1.5-41 ng/mL.
- As metals within urine, cadmium and arsenic compounds were measured. The median value of 340 people who had cadmium measured in their urine was 0.79 μ g/gCr, with a range of 0.11-4.7 μ g/gCr.
- As metals via food, total mercury, methyl mercury, lead, cadmium, total arsenic, copper, selenium, zinc, manganese intake were measured for 75 participants. The median value of methyl mercury was 0.055 μ g/kg body weight/day, with a range of N.D.-0.29 μ g/kg body weight/day. No participants exceeded the methyl mercury TDI of 2.0 μ g/kg body weight/week (subjected to pregnant or possibly pregnant women), established in Japan. In addition, the median value of cadmium was 0.23 μ g/kg body weight/day, with a range of 0.059-0.57 μ g/kg body weight/day. No participants exceeded the cadmium TDI of 7 μ g/kg body weight/week, established in Japan.

Results from other chemical compounds (including pesticides and plasticizers)

- Other chemical compounds including pesticides and plasticizers in blood of 60 people and urine of 340 people were measured.

Results from the POPs survey

- The concentrations of POPs by Stockholm Convention were measured in the blood of 86 people. In addition, the intake of POPs from food was calculated for 15 people (conducted only in FY 2011).

1. Overview of “Survey of the Exposure to chemical compounds in Humans”

The Environmental Risk Assessment Office, Environmental Health Department, Ministry of the Environment, Japan, carried out a survey entitled “Survey on the accumulation of dioxins and other chemical compounds in humans” during FY 2002–2010. In this survey, blood dioxin concentrations were measured in 2,264 people living in typical environments in Japan. In addition, dioxin concentrations in the food of 625 people were measured and the intake from food was calculated (see Supplementary Information). Three areas were selected for each fiscal year for “Survey of the Exposure to Dioxins and other chemical compounds in Humans”, and surveys were conducted as “Survey of the Exposure to chemical compounds in Humans” in FY 2011 and as “Survey of the Exposure to chemical compounds in Humans” since FY 2012. Blood and urine were collected from the participating residents, and the accumulation of dioxins and other chemical compounds were measured. Furthermore, a food study (duplicate portions study) was conducted for a subset of survey subjects. The concentrations of chemical compounds in the food were measured, and the intakes were calculated. Thereafter, blood specimens of 410 people and urine specimens of 411 people from 15 survey regions were analyzed and the intakes of chemical compounds from food were estimated for 75 people.

“Survey of the Exposure to chemical compounds in Human”

Organization responsible for the survey	Environmental Risk Assessment Office, Environmental Health Department, Ministry of the Environment, Japan
Survey period	FY 2011 and thereafter
Survey regions	Three regions per year
Survey specimens	Blood (to ascertain the accumulation of chemical compounds in the body), urine (to ascertain the excreted amounts of rapidly-metabolized chemical compounds), and food (to ascertain the amount of intake of chemical compounds).
Number of subjects	411 people (FY 2011, 86 people; FY 2012, 84 people; FY 2013, 83 people; FY 2014, 81 people; FY 2015, 77 people; and 75 people participated in the food study).

2. Survey methods

2-1 Target regions and subjects

In “Survey on the accumulation of dioxins and other chemical compounds in humans” conducted during FY2002–2010, Japan was divided into five regions, of which one prefecture was selected for each fiscal year. In a prefecture, three areas each classified as urban, agricultural, or fishery area were selected. From FY 2011, three regions were selected from regions of participated in previous studies. The local administrative authorities recruited the study subjects from local residents, including those who have participated in previous studies, fulfilling the following criteria.

Study subject criteria

- Age: 40–59
- A resident of the survey region for 10 years or more
- Rarely absent from the survey region for work or other reasons
- Ability to provide blood samples with no restrictions (e.g., no anemia)

2-2 Methods

● Blood (all subjects)

Blood was collected from survey subjects by a nurse in the presence of a physician. Generally, fasting blood samples were taken.

Analytes

Analytes	FY 2011	FY 2012	FY 2013	FY 2014	FY 2015
• Chlorinated dioxins	○	○	○	○	○
• Brominated dioxins		○			
• Organic fluorine compounds	○		○	○	○
• Metals	○	○	○	○	○
• Hydroxylated polychlorinated biphenyls (PCB)		○	○	○	○
• POPs	○				
• General health examination items: blood count, hepatic function, renal function, and glucose metabolism	○	○	○	○	○
• Health effect indexes: thyroidal function, allergic function, and fatty acids	○	○	○	○	○

● Urine (sampled from all subjects; analysis for a subset of the subjects)

Urine was collected in a container on the same day of blood sampling.

Analytes

Analytes	FY 2011	FY 2012	FY 2013	FY 2014	FY 2015
• Pesticides and their metabolites (organophosphate, pyrethroid etc.)	○	○	○	○	○
• Plasticizers, phthalate metabolites, and bisphenol A	○	○	○	○	○
• Metals (cadmium and arsenic)	○	○	○	○	○
• Other chemical substances (PAH, cotinine, and caffeine)		○	○	○	○
• General health examination items: specific gravity, glucose, and protein	○	○	○	○	○

● Food (conducted on a subset of the subjects)

The food study was conducted over three days during the survey period. A “duplicate portions study” was conducted whereby duplicates of the subjects’ meals were stored in containers and collected afterwards. Nutritionists checked the food items and weight. The meals were then homogenized, the chemical compounds were measured, and the intake of each chemical compound (kg body weight per day) was estimated.

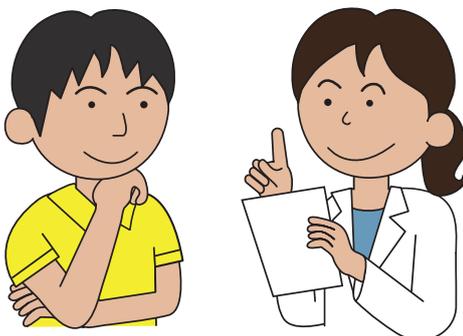

Analyzed chemicals	FY 2011	FY 2012	FY 2013	FY 2014	FY 2015
• Chlorinated dioxins	<input type="radio"/>				
• Organic fluorine compounds	<input type="radio"/>				
• Metals	<input type="radio"/>				
• POPs	<input type="radio"/>				

● Lifestyle survey (questionnaire)

A public health nurse or a nutritionist investigated the lifestyles of survey subjects through individual interviews, referring to the questionnaire that was answered in advance.

• Personal medical history, residential history, occupational history, smoking habit, dietary history, lifestyle, and birth history

3. Results and Discussion

3-1 Dioxins survey

3-1-1 Blood (chlorinated dioxins)

● Results summary

The blood dioxin concentrations are shown in Table 1. The average concentration of the 410 survey subjects was 11 pg-TEQ/g-fat. The range of the concentration was 0.39–56 pg-TEQ/g-fat.

□ Table 1. Statistics for blood dioxin concentrations

(unit: pg-TEQ/g-fat)

	FY 2011 (n=86)	FY 2012 (n=84)	FY 2013 (n=83)	FY 2014 (n=81)	FY 2015 (n=76)	Total (n=410)
PCDDs+PCDFs +Co-PCBs						
Average	17	10	9.9	9.8	9.7	11
Standard deviation	10	6.9	6.6	5.9	7.0	8.1
Median	14	9.0	8.9	8.3	8.4	9.5
Range	0.83 ~ 56	0.42 ~ 40	0.40 ~ 33	1.1 ~ 34	0.39 ~ 49	0.39 ~ 56

● Comparison with previous survey results

Table 2 summarizes the comparison of the present results with the results from the “Survey on the accumulation of dioxins and other chemical compounds in humans (FY 2002 to FY 2010),” conducted on 2,264 subjects. Although it was difficult to compare in a simplified manner because the average age and number of subjects differed between the surveys, the blood dioxin concentrations obtained in the present survey were generally within the range of concentrations obtained in the previous surveys.

□ Table 2. Comparison with previous survey results

(unit: pg-TEQ/g-fat)

Survey name	Survey on the Accumulation of Dioxins and other chemical compounds	This survey
Survey year	FY 2002 to FY 2010	FY2011 to FY2015
Subjects	People living in the general environment	People living in the general environment
Number of subjects	2,264	410
Age		
Average (years)	44.5	50.1
Range	15 ~ 76	24 ~ 77

Range	0.96 ~ 95	1.2 ~ 56

3-1-2 Food (chlorinated dioxins)

● Results summary

Table 4 summarizes the dioxin intake from food. The average intake was 0.50 pg-TEQ/kg bw/day with a range of 0.035–2.4 pg-TEQ/kg bw/day. Conceivable routes of intake include food, ambient air, and soil, but the intake from food is estimated to account for the largest portion (see the p33). In Japan, the tolerable daily intake (TDI) for dioxins is 4 pg-TEQ/kg bw/day as stipulated by the Law Concerning Special Measures against Dioxins. The TDI indicates the maximum ingestion of a given chemical substance per kg of body weight/day, and humans do not show adverse health effects even when the chemical is ingested below this level over a long period. No subjects in the survey exceeded this TDI value.

□ Table 4. Statistics for intake of intake from food

(unit: pg-TEQ/kg bw/day)

	FY 2011 (n=15)	FY 2012 (n=15)	FY 2013 (n=15)	FY 2014 (n=15)	FY 2015 (n=15)	Total (n=75)

3-3-3 Food

● Results summary

Metals (total mercury, methyl mercury, lead, cadmium, total arsenic, copper, selenium, zinc, and manganese) were measured in the food (Table 12). In Japan, among the metals measured in this survey, the TDIs have been established methyl mercury and cadmium. The TDIs for methyl mercury and cadmium are $2.0 \mu\text{g}/\text{kg}$ body weight/week (subjected to pregnant or possibly pregnant women) and $7.0 \mu\text{g}/\text{kg}$ body weight/week, respectively. No subjects in this survey exceeded these TDIs.

□ Table 12. Statistics for the intake of metals from food

(unit : $\mu\text{g}/\text{kg}$ bw/day)

Metals	FY 2011 (n=15)	FY 2012 (n=15)	FY 2013 (n=15)	FY 2014 (n=15)	FY 2015 (n=15)	Total (total mercury • methyl mercury • lead • cadmium: n=75, manganese: n=45, and others:n=60)
Total mercury

Chemical compounds measured in this survey

1. Dioxins

1.1 Structure of dioxins

Polychlorodibenzo-p-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs) are collectively called dioxins. Co-planar polychlorinated biphenyls (co-planar PCBs) possess toxicity similar to those of dioxins, therefore are also known as dioxin-like compounds. Dioxins by definition include PCDDs, PCDFs, and co-planar PCBs according to Japan's Law Concerning Special Measures against Dioxins, promulgated on July 16, 1999. Accordingly, throughout this report, the term "dioxins" refers to PCDDs, PCDFs, and co-planar PCBs. The chemical structure of a dioxin molecule is generally composed of two rings of six-carbon atoms (benzene rings; the figure below) bound by oxygen atom(s) (shown as "O" in the figure below) with chlorine or hydrogen atoms attached (at numbered positions 1–9 and 2'–6' in the figure below). There are 75 types of PCDDs, 135 types of PCDFs, and 12 types of coplanar PCBs, and the variations depend on the numbers and locations of the attached chlorine atoms. Among these dioxins, 29 types have toxicities similar to 2,3,7,8-TCDD.

* PCB compounds with two benzene rings on the same plane, are known as co-planar PCBs. Note that some PCBs without the planar structure but possess dioxin-like toxicity, are also classified as co-planar PCBs for a regulatory purpose.

1.2 Properties of dioxins

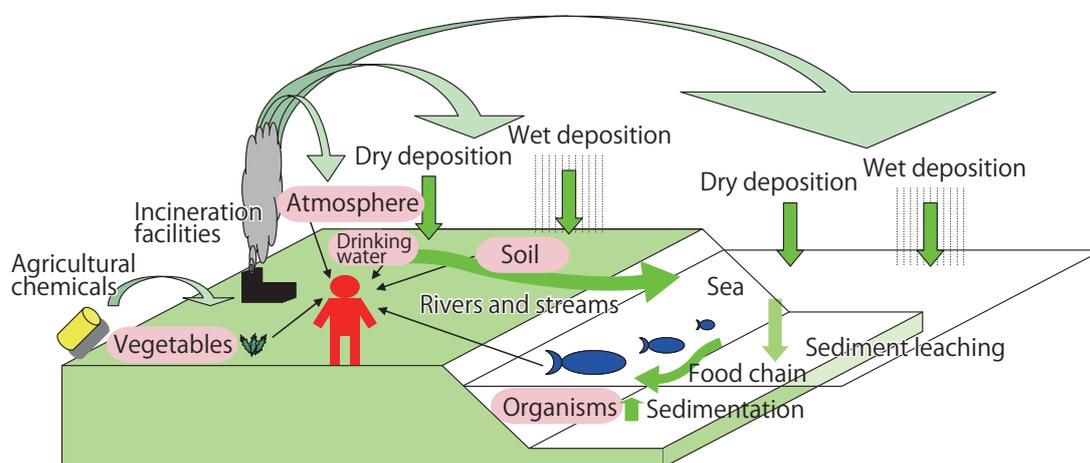

Dioxins are generally colorless solids of very low water solubility and low vapor pressure, but characteristically exhibit a high degree of solubility in fats and oils. They are generally stable, do not react easily with other compounds, acids, and alkalis, and are considered to decompose gradually in the presence of solar ultraviolet light.

1.3 Dioxin toxicity

Carcinogenicity and chronic toxicity are health risks posed by dioxins. In rats, dioxins have been reported to show carcinogenicity, such as the production of hepatocellular carcinoma, follicular adenoma of the thyroid, lymphoma, and other cancers. Dioxins are known to act as promoters for the carcinogenic mechanism; that is, dioxins do not act directly on genes, instead they promote the carcinogenic activity of other carcinogens. At present, the International Agency for Research on Cancer (IARC) and the World Health Organization (WHO) have classified 2,3,7,8-TCDD as a human carcinogen. In terms of hepatotoxicity, it is recognized to cause elevated liver enzymes and hyperlipidemia. However, for assessing the consequences of dioxin exposure during fetal stages, reproductive organ toxicity, central nervous system toxicity, and immune system toxicity received attentions when the WHO reevaluated the risks of dioxins and related compounds in 1998, as well as risk assessments that are being conducted both nationally and internationally. Shortened anogenital distance in males, congenital abnormalities in vagina, diminished learning ability, diminished resistance to viral infection, and other outcomes in laboratory animals. At present, the effects of dioxins are widely recognized to develop due to endocrine disruption through the arylhydrocarbon receptor (AhR) within cells. However, further studies are required because there is limited data available regarding the appearance of these diverse toxicities.

1.4 Generation and behavior of dioxins in the environment

Dioxins are not produced intentionally except for research purposes, such as the production of standard materials for dioxin analysis. Dioxins are by-products generated when substances containing carbon, oxygen, hydrogen, and chlorine are heated. The major source of dioxins today is waste incineration, particularly the incineration of plastic waste and other products made from fossil fuels. Dioxins are formed in combustion processes and emitted into the air when they are not captured by waste-gas mechanisms. Other sources include emissions from electric steel-making furnaces, cigarette smoke, and automobile exhaust. Some reports indicate that dioxins may have accumulated in bottom sediment in aquatic environments owing to the past use of PCBs and some types of agricultural chemicals, which contain dioxins as impurities. The behavior of dioxins in the environment is not fully known. Dioxins in the air presumably are adsorbed to particulate matter, fall to the ground, and then pollute soil and water. It is considered that over long period of time, these dioxins and others are released into the environment by various other pathways, and they ultimately accumulate in aquatic sediments and enter the food chain when ingested by plankton and fish, thereby accumulating in various organisms. Although dioxins are mostly anthropogenically produced, small amounts are generated in nature through forest fires and volcanic activities.

1.5 Brominated dioxins

Brominated dioxins have a similar structure to chlorinated dioxins, whereby some chlorines are substituted with bromines. Similar to chlorinated dioxins, brominated dioxins are not produced intentionally except for research purposes and are by-products that occur when heat is applied to organobromine compounds and in combustion processes. They are mainly produced through heating processes during the production and processing of plastics including brominated flame retardants. Their toxicity and health effects are less understood than chlorinated dioxins.

2. Organic fluorine compounds

PFOS and PFOA are organic fluorine compounds that have fluoride atom(s) bound to carbon. Carbon and fluoride are strongly bound to each other, and the compounds are highly resistant to heat and chemicals. These compounds have been used widely as “surfactants” because they are readily soluble in oil and water, and are used in water-repellent sprays, foam fire extinguishers, and until very recently, in coatings of nonstick frying pans. However, it has been reported that they are resistant to decomposition in the environment and in living organisms, and that they have substantial bioaccumulation properties. PFOS is listed as a POPs in the Stockholm Convention on Persistent Organic Pollutants. In the present survey, organic fluorine compounds including PFOS and PFOA were studied in blood and food.

□ Table 21. Organic fluorine compounds

Chemical compound	Usage	Measurement case in Japan (average)	Standard; Tolerable intake
Fluorine compounds	Used in water-repellent sprays and foam fire extinguishers as surfactants. (PFOS, PFOA)	<p>< Blood ></p> <p>PFHxA: <0.091 ng/mL (60 females; Kashino et al., 2011 ※ plasma)</p> <p>PFHpA: <0.079 ng/mL (60 females; Kashino et al., 2011 ※ plasma)</p> <p>N.D. ng/mL (14 females; Nakai et al., 2008)</p> <p>PFOA: 0.48 ~ 6.93 ng/mL (60 females; Kashino et al., 2011 ※ plasma)</p> <p>1.72 ng/mL (14 females; Nakai et al., 2008)</p> <p>4.0 ng/mL (97 males; Harada et al., 2003-2004 ※ serum)</p> <p>4.4 ng/mL (103 females; Harada et al., 2003-2004 ※ serum)</p> <p>PFNA: 0.43 ~ 3.16 ng/mL (60 females; Kashino et al., 2011 ※ plasma)</p> <p>0.87 ng/mL (14 females; Nakai et al., 2008)</p> <p>PFDA: 0.18 ~ 1.17 ng/mL (60 females; Kashino et al., 2011 ※ plasma)</p> <p>PFTeDA: N.D. ng/mL (60 females; Kashino et al., 2011 ※ plasma)</p> <p>PFOS : 0.86 ~ 10.96 ng/mL (60 females; Kashino et al., 2011 ※ plasma)</p> <p>2.86ng/mL (14 females; Nakai et al., 2008)</p> <p>18.3 ng/mL (97 males; Harada et al., 2003-2004 ※ serum)</p> <p>11.7 ng/mL (103 females; Harada et al., 2003-2004 ※ serum)</p> <p>< Food ></p> <p>PFOS: 0.98 ng/kg bw/day (ND and/or below = 0)</p> <p>12.1 ng/kg bw/day (ND and/or below = 1/2 ND)</p> <p>(Maitani et al., 2007 market-basket system; Mitani et al.)</p> <p>PFOA: 0.06 ng/kg bw/day (ND and/or below = 0)</p> <p>11.5 ng/kg bw/day (ND and/or below = 1/2 ND)</p> <p>(Maitani et al., 2007 market-basket system)</p>	※ Tolerable intake is not established.

3. Metals

Metals are widely distributed on the earth and are used for various purposes. However, some metals are potentially toxic to organisms. In the past, Japan has experienced damage to the health of people by environmental heavy metal pollution, such as Minamata disease caused by methyl mercury and Itai-Itai Disease caused by cadmium.

□ Table 22-1. Metals studied in this survey

Chemical compounds	Usage	Measurement case in Japan (average)	Standard; Tolerable intake
Total mercury/Methyl mercury	Metal mercury is used in fluorescent lights, amalgam, batteries, catalysts, and others. Methyl mercury is produced by methylation of metal mercury. Methyl mercury have higher toxicity.	<p>< Total mercury / blood > 5.4 ng/mL (600 mothers; Shimada et al., 2008) 5.18 ng/mL (115 mothers; Sakamoto et al., 2007) 18.2 ng/mL (56 females; Yamauchi et al., 1994)</p> <p>< Total mercury / food > 0.225 μ g/kg bw/day (Tokyo, 2005; 10 samples by duplicated portion method) 0.17 μ g/kg bw/day (Tokyo, 2014 market-basket system)</p> <p>< Methyl mercury / food > 0.198 μ g/kg bw/day (Tokyo, 2005; 10 samples by duplicated portion method) 0.13 μ g/kg bw/day (Tokyo, 2014; market-basket method)</p>	< Methyl mercury > 2.0 μ g/kg bw/week
Lead	Used widely in electrodes, weight, glass products, solder, and others.	<p>< Blood > 10.7 ng/mL (352 people:1-15 years ;Yoshinaga et al., 2008-1010) 13 ng/mL (137 people including infant; Tokyo, 2006)</p> <p>< Food > 0.129 μ g/kg bw/day (319 samples by duplicated portion method; Food safety commission of Japan, 2006-2010) 0.18 μ g/kg bw/day (Tokyo, 2014; maket-basket method)</p>	※ Tolerable intake is not established.
Cadmium	Used in watch batteries, plating materials, and others. Cadmium is produced and recovered during the zinc refinery process.	<p><Blood> 2.54 μ g/L (1243 females; kayama et al., 2010-2011)</p> <p>< Urine > 3.46 μ g/g Cr (1243 females; Kayama et al., 2000 – 2001) 1.26 μ g/g Cr (10753 females; Ikeda et al., 2000 – 2001)</p> <p>< Food > 0.320 μ g/kg bw/day (Tokyo, 2005 10 samples by duplicated portion method) 0.34 μ g/kg bw/day (Tokyo, 2014; market-basket method)</p>	7 μ g/kg bw/week

□ Table 22-2. Metals studied in this survey

Chemical compounds	Usage	Measurement case in Japan (average)	Standard; Tolerable intake
Arsenic	In the past, arsenic compounds were used in rat poisons. Organic arsenic is found in seafood (seaweeds, shrimps, and crabs) but are basically non-toxic. Inorganic arsenic is highly toxic.	<p>< Total Arsenic / blood > 5.0 ng/mL (137 people including infant; Tokyo, 2006)</p> <p>< Arsenic speciation / urine > MMA: 2.01 μ g/g Cr DMA: 40 μ g/g Cr (248 residents near metropolitan area Chiba et al., 2001)</p> <p>As (V) 0.2 μ g/g Cr As (III) 4.0 μ g/g Cr MMA: 3.2 μ g/g Cr DMA: 38.5 μ g/g Cr AB: 71.4 μ g/g Cr (142 males; Nakajima et al., 2001)</p> <p>< Total Arsenic / food > 3.44 μ g/kg bw/day (319 samples by duplicated portion method Food safety commission of Japan, 2006-2010)</p>	※ Tolerable intake is not established.
Copper	Used widely in electric wire, roofing, and others.	<p>< Blood > 950 ng/mL (145 males) 970 ng/mL (163 females) (Saitoh et al., 1980)</p> <p>< Food > 1.12 mg/day (8,047 samples; Ministry of Health, Labour and Welfare 2014)</p>	10 mg/day (tolerable upper intake level; males and females 18 years or older)
Selenium	Used in photo sensitive drum of copier, colorant for glass, and soil amendments for place of selenium deficiency.	<p>< Blood > 157 ng/g : males 157 ng/g : females (331 subjects; Seki et al., 1981)</p> <p>< Food > 0.17 mg/day (39 males) 0.19 mg/day (40 females) (Duplicated portion method Chiba et al., 2003)</p>	330 ~ 460 μ g/day (tolerable upper intake level; males and females 18 years or older)
Zinc	Used widely in corrugated galvanised iron, pigment, alloy material and cosmetic, and others.	<p>< Blood > 8,540 ng/mL (145 males) 8,150 ng/mL (163 females) (Saitoh et al., 1980)</p> <p>< Food > 7.9 mg/day (8,047 samples; Ministry of Health, Labour and Welfare, 2014)</p>	35 ~ 45 mg/day (tolerable upper intake level; males and females 18 years or older)
Manganese	Used in Battery materials and fertilizer raw materials.	<p>< blood > 13.2 μ g/L (1,420 females; Ikeda et al., 2010)</p> <p>< Food > 5.53 mg/day (39 males) 6.11 mg/day (40 females) (Duplicated portion method Chiba et al., 2003)</p>	11 mg/day (tolerable upper intake level; males and females 18 years or older)

4. Other chemical compounds (including pesticides and plasticizers)

□ Table 23-1. Pesticides, plasticizers, and others studied in this survey

Chemical compound	Usage	Measurement case in Japan (average)
Hydroxylated PCB	Metabolite of PCB.	< Blood > 120 pg/g (128 pregnant women; Hisada et al., 2009-2011)
Phthalate monoesters	Used as plasticizer in plastic, adhesive agents, and others.	< Urine > MBP : 52.2 μ g/g Cr (48.1 ng/mL) MEHP : 5.84 μ g/g Cr (4.44 ng/mL) MEHHP : 10.1 μ g/g Cr (8.61 ng/mL) MEOHP : 11.0 μ g/g Cr (9.2 ng/mL) MBZP : 4.70 μ g/g Cr (3.46 ng/mL) (149 pregnant women; Suzuki et al., 2010) ※ median
Bisphenol A	Used as monomer or ingredients in plastic manufacturing.	< Urine > N.D. μ g/g Cr (39 out of 56 pregnant women) 1.7 μ g/g Cr (median ; 17 out of 56 pregnant women) (Fujimaki et al., 2003)
Organophosphorous compound metabolites	Used in pesticides, disinfectant, wood preservatives, and others (metabolites were measured).	< Urine > DMP : 1.5 μ g/L (73 subjects, Toyama) : 3.1 μ g/L (60 subjects, Tokyo) DMTP : 3.2 μ g/L (73 subjects, Toyama) : 5.8 μ g/L (60 subjects, Tokyo) DEP : 0.8 μ g/L (73 subjects, Toyama) : 1.2 μ g/L (60 subjects, Tokyo) DETP : <0.5 μ g/L (73 subjects, Toyama) : <0.5 μ g/L (60 subjects, Tokyo) (Nakazaki et al.,)
Pyrethroid pesticide metabolites	Used in pesticides, insecticides, and others (metabolites were measured).	< Urine > PBA : 0.40 μ g/g Cr (42 males Toshima et al., 2010) PBA : 0.73 μ g/g Cr (448 subjects; Ueyama et al., 2009)
Carbamate pesticide metabolites	Used in pesticides, insecticides, and others (metabolites were measured).	—
Triclosan	Used as disinfectant	—
Acephate	A type of organophosphorus pesticides. Used widely as pesticides and insecticides, known as "Orthoran".	—
Methamidophos	A type of organophosphorus pesticide. Used as pesticides and insecticides (banned to use in Japan).	—
Imidachloprid metabolite	Metabolite of neonicotinoid pesticide.	—
Fenitrothion metabolite	Metabolite of fenitrothion.	—
p-nitrophenol	Metabolite of pesticides.	—
Deet	Used as mosquito and mite repellent.	—

□ Table 23-2. Pesticides, plasticizers, and others studied in this survey

Chemical compound	Usage	Measurement case in Japan (average)
Parabens	Used as antiseptic (antibacterial) agent in food, medicine, cosmetics, etc.	< Urine > Methylparaben : 109 μ g/g Cr Ethylparaben : 8.0 μ g/g Cr Propylparaben : 33.5 μ g/g Cr Butylparaben : 0.743 μ g/g Cr (111 pregnant women; Shirai et al., 2007-2010) ※ median
Iodine	Essential element for human and is the main component of thyroid hormone. Found abundantly in sea weeds. Deficiency causes hyperthyroidism, but excessive intake also causes thyroid abnormalities as well.	< Urine > 259.5 μ g/g Cr (622 pregnant women; Orito et al., 2005-2006) ※ median
Perchloric acid	Has strong oxidizing effect. Used as analytical chemistry reagent, metal/ alloy/ mineral ore solvent, organic synthesis catalysis, and as manufacturing material of perchloric acid and its derivatives.	—
PAHs metabolites	Metabolite of PAHs, found mainly as mixtures in tar, crude oil, and in petroleum.	< Urine > 1-Hydroxypyrene : 124 μ g/g Cr (149 pregnant women; Suzuki et al., 2010) ※ median
Cotinine	Metabolite of nicotine found in tobacco.	< Urine > 16 μ g/g Cr (smoking parents) 12 μ g/g Cr (Only the mother smokes) 3 μ g/g Cr (only the father smokes) 1 μ g/g Cr (non-smoking parents) (927 three year old children; Tateishi et al.) 3,048 μ g/g Cr (smoking) 28.7 μ g/g Cr (non-smoking and passive smoking) 33.9 μ g/g Cr (non-smoking and non- passive smoking) (504 adults; Sakanashi et al., 2009)
8-OHdG	8-OHdG is generated when DNA is exposed to UV, radiation, and/or chemical substances.	< Urine > 15.4 μ g/g Cr (248 healthy people; Yamauchi et al., 2002)
Caffeine	Naturally derived organic compound found abundantly in coffee, tea, and chocolate.	—
Benzophenone-3	Used in sunscreen cosmetics due to its ultraviolet absorption effect.	—
Phytoestrogens	Found abundantly in leguminous plants (bean plants) such as soy beans, and act as female hormone .	< Urine > Daizein: 1,000 μ g/g Cr Genistein: 860 μ g/g Cr (80 adult women; Tsukane et al.)

5. POPs

POPs is the abbreviation of Persistent Organic Pollutants and have the following properties:

- they remain intact for exceptionally long period of time,
- they accumulate in bodies of organisms,
- they can be transported long distances and are widely distributed on the earth,
- they have toxic effects within organisms.

The Stockholm Convention on Persistent Organic Pollutants is an international treaty. Initially, 12 POPs were recognized, which has now added up to 22. These compounds include those produced and used intentionally as pesticides and others. On the other hand, there are compounds like dioxins, which could be produced in the process of combustion or manufacturing of other chemicals. In the Convention, each member State is to prohibit the production, use, import and export of POPs, and to take every measure possible to eliminate and reduce the unintentional production of compounds. Furthermore, each member State is encouraged to undertake measures for POPs under the Stockholm Convention. Considering this, monitoring surveys on the environment and biological samples are conducted by Ministry of the Environment, Japan. In the present survey, all POPs listed in the Stockholm Convention were measured in blood and food.

□ Table 24. POPs studied in this survey

Chemical compounds	Usage
Dioxins	Produced unintentionally due to combustion, as well as during the manufacture of chlorinated substances
PCBs	Used as heat exchange fluids, in electric transformers, and as additives in carbonless copy papers and such
DDT	Used as hygiene pesticides and insecticides
Chlordane	Used to control termites and as pesticides
Aldrin	Used as pesticides
Dieldrin	Used as pesticides, insecticides, and termite control
Endrin	Used as pesticides
Hexachlorobenzene (HCB)	Used as material for herbicide manufacturing
Heptachlor	Used as pesticide and termite control
Toxaphene	Used as pesticides overseas
Mirex	Used as pesticides overseas
PBDE	Used as fire-retardant
Pentachlorobenzene	Used as chemical intermediate of agricultural fungicides
HCH	Used as pesticides
Chlordecone	Used as insecticides overseas
Hexabromobiphenyl	Used as fire-retardant
Endosulfan	Used as pesticides and insecticides
HBCD	Used as fire-retardant

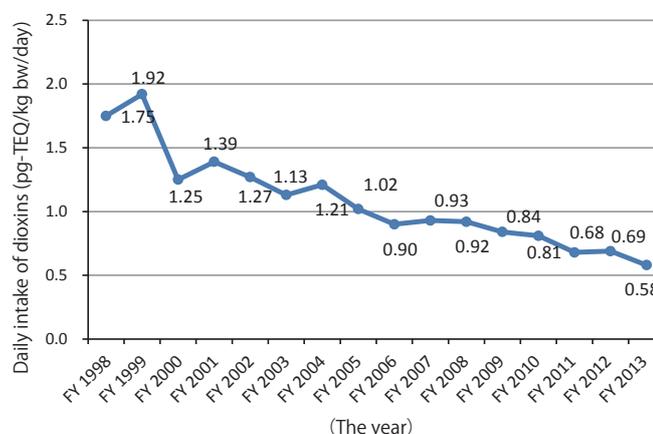

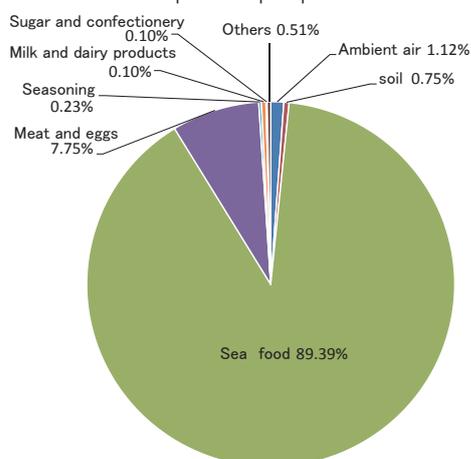

7. Dioxin intake

In Japan in June 1999, the TDI of dioxins was set at 4 pg-TEQ/kg bw/day based on the available scientific information at the time. The safety of the total amount of dioxins ingested by humans is evaluated by comparisons with this value.

On average, the total daily intake of dioxins by the Japanese people is estimated to be approximately 0.58 pg-TEQ/kg bw/day. These levels are below the TDI and therefore considered to be below the level that can cause adverse effects on human health. Conceivable routes of intake include food, ambient air, and soil, but the intake from food is estimated to account for the largest portion (Figure 10). Figure 11 shows the chronological change in estimated total daily intake of dioxins by the Japanese people using the results of “Survey on the Daily Intake of Dioxins from Food” (Ministry of Health, Labour and Welfare, Japan). Enforcement of the “Law Concerning Special against Dioxins (January, 2000)” has greatly decreased emission of dioxins to environment. Dioxin concentrations in food and the environment (ambient air and soil) have also decreased. As a result, the total daily intake of dioxins by the Japanese people showed a trend of decrease.

It is anticipated that the total daily intake will be reduced further owing to continuous measures against reduced emissions of dioxins.

□ Figure 10 Specifications for the average daily intake of dioxins by the Japanese people ^{Note1} □ Figure 11 Chronological change in the average daily intake of dioxins by Japanese people ^{Note2}

Note 1 : Graphed by MOE from the data of “FY 2013 Environmental Survey of Dioxins” (MOE) and “FY 2013 Survey on the Daily Intake of Dioxins from Food, Health and Labour Sciences Research” (Ministry of Health, Labour, and Welfare, Japan).
 Note 2 : “FY 2013 Survey on the Daily Intake of Dioxins from Food, Health and Labour Sciences Research.”(MHLW).
