Chapter 3 Results of the Environmental Monitoring in FY2021

1. Purpose of the monitoring

Environmental Monitoring provides annual surveys of the environmental persistence of target chemicals as listed in the Stockholm Convention, chemicals that while undesignated are still subject to review for potential risk, and/or highly persistent chemicals annotated as Specified Chemical Substances and Monitored Chemical Substances under the Law Concerning the Examination and Regulation of Manufacture, etc. of Chemical Substances (aka, the Chemical Substances Control Law), all target chemicals whose year to year changes in persistence in the environment must be understood.

*POPs: persistent organic pollutants

2. Target chemicals

In the FY2021 Environmental Monitoring, 11 chemicals (groups) were designated as target chemical.

3 of the target chemicals (groups) were Polychlorinated biphenyls (PCBs), Hexachlorobenzene¹ and DDTs², which were listed as Persistent Organic Pollutants (POPs) initially in the Stockholm Convention in 2004³. 2 of them were Perfluorooctane sulfonic acid (PFOS)⁴ and Pentachlorobenzene, which were adopted to be the POPs at fourth meeting of the Conference of the Parties (COP) held 2009. 1 of them was Endosulfans, which was adopted to be the POPs at fifth meeting of COP held 2011. 2 of them were Polychlorinated Naphthalenes⁵ and Hexachlorobuta-1,3-diene, which were adopted to be the POPs at seventh meeting of COP held 2015. 1 of them was Short-chain chlorinated paraffins⁶, which was adopted to be the POPs at eighth meeting of COP held 2017. 1 was Perfluorooctanoic acid (PFOA)⁷, which was adopted to be the POPs at ninth meeting of COP held 2019. Another was Perfluorohexane sulfonic acid (PFHxS)⁸, which was adopted to be the POPs at tenth meeting of COP held 2021 and 2022.

The combinations of target chemicals and the monitoring media are given below.

- (Note 1) cis-Chlordane and trans-Chlordane were adopted as target chemical of the Stockholm convention on Persistent Organic Pollutants. In the survey, Chlordanes including cis-Chlordane, trans-Chlordane Oxychlordane, cis-Nonachlor and trans-Nonachlor are target chemicals.
- (Note 2) p,p'-DDT and o,p'-DDT were adopted as target chemicals of the Stockholm convention on Persistent Organic Pollutants. In the survey, DDTs including environmental degraded products p,p'-DDT, o,p'-DDT, p,p'-DDD and o,p'-DDD were target chemicals.
- (Note 3) Up to FY2009, the 11 target chemicals (groups) were monitored each fiscal year. 10 out of the 11 target chemicals (groups) were exceptions of Polychlorinated dibenzo-p-dioxin (PCDDs) and Polychlorinated dibenzofurans (PCDFs) from 12 chemicals (groups) listed as the POPs initially in the Stockholm Convention. Another was HCHs (Hexachlorohexanes). As of FY2010, chemicals (groups) adopted or considerd to be the POPs in the convention have been monitored too, and adjustments made to implementation frequency. In FY2021, 11 chemicals (groups) that have been designated as target chemicals (groups) in this Environmental Monitoring were not moniterd. They were Aldrin, Dieldrin, Endrin, Chlordanes⁹, Heptachlors, Toxaphenes¹⁰, Mirex, HCHs (Hexachlorohexanes)¹¹, Chlordecone, Hexabromobiphenyls, Polybromodiphenyl ethers (Br₄~Br₁₀)¹², 1,2,5,6,9,10-Hexabromocyclododecanes¹³, Pentachlorophenol and its salts and esters¹⁴ and Dicofol. Up to the latest results of the 14 chemicals (groups) have been included in this report for purpose of reference.
- (Note 4) Perfluorooctane sulfonic acid (PFOS), its salts and Perfluorooctane sulfonyl fluoride were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants. The survey of the

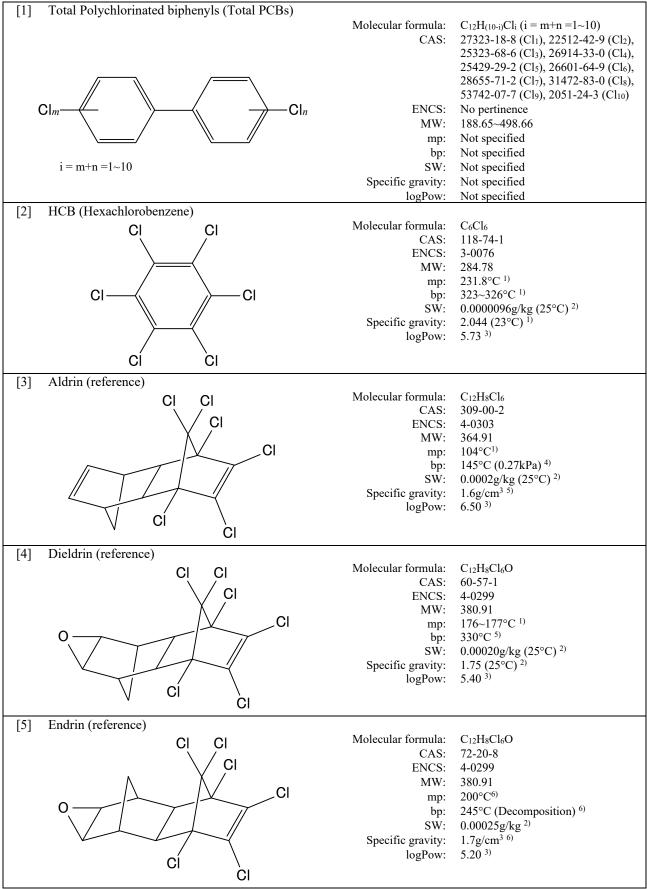

Perfluorooctane sulfonic acid (PFOS) only monitored linear octyl Perfluorooctane sulfonic acid (PFOS).

- (Note 5) PCNs (Cl₂~Cl₈) was adopted as target chemicals at the COP7 of the Stockholm convention on Persistent Organic Pollutants. In the survey, PCNs including those with one (1) chlorine are target chemicals.
- (Note 6) Chlorinated paraffins (C₁₀~C₁₃) was adopted as target chemicals at the COP8 of the Stockholm convention on Persistent Organic Pollutants. In the survey, Chlorinated paraffins with 5~9 chlorines are target chemicals in surface water, sediment and wildlife, and Chlorinated paraffins with 4~7 chlorines are target chemicals in air.
- (Note 7) Perfluorooctanoic acid (PFOA), its salts and PFOA-related compounds were adopted as target chemicals at the COP9 of the Stockholm convention on Persistent Organic Pollutants. The survey of the Perfluorooctanoic acid (PFOA) only monitored linear octyl Perfluorooctanoic acid (PFOA).
- (Note 8) Perfluorohexane sulfonic acid (PFHxS), its salts and PFHxS-related compounds were adopted as target chemicals at the COP9 of the Stockholm convention on Persistent Organic Pollutants. The survey of the Perfluorohexane sulfonic acid (PFHxS) only monitored linear hexyl Perfluorohexane sulfonic acid (PFHxS).
- (Note 9) Heptachlor was adopted as target chemical of the Stockholm convention on Persistent Organic Pollutants. In the survey, Heptachlors including *cis*-Heptachlor epoxide and *trans*-Heptachlor epoxide are target chemicals.
- (Note 10) Chlorobornane and Chlorocamphene of industrial blended material (about 16,000 congeners or isomer) were adopted as target chemicals of the Stockholm convention on Persistent Organic Pollutants. In the survey, 2endo,3-exo,5-endo,6-exo,8,8,10,10-octachlorobornane (Parlar-26), 2-endo,3-exo,5-endo,6-exo,8,8,9,10,10nonachlorobornane (Parlar-50) and 2,2,5,5,8,9,9,10,10-Nonachlorobornane (Parlar-62) are target chemicals.
- (Note 11) In the COP4, α -HCH, β -HCH and γ -HCH (synonym: Lindane) were adopted to be POPs among HCHs, but in this Environmental Monitoring, HCHs which were able to include δ -HCH were designated as target chemicals.
- (Note 12) Tetrabromodiphenyl ethers, Pentabromodiphenyl ethers, Hexabromodiphenyl ethers, and Heptabromodiphenyl ethers were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants. Decabromodiphenyl ether was adopted as target chemicals at the COP8 of the Stockholm convention on Persistent Organic Pollutants.In the survey, Polybromodiphenyl ethers including those from 4 to 10 bromines are target chemicals.
- (Note 13) α -1,2,5,6,9,10-Hexabromocyclododecane, β -1,2,5,6,9,10-Hexabromocyclododecane and γ -1,2,5,6,9,10-Hexabromocyclododecane were adopted as target chemicals at the COP6 of the Stockholm convention on Persistent Organic Pollutants. In the survey, 1,2,5,6,9,10-Hexabromocyclododecanes including δ -1,2,5,6,9,10-Hexabromocyclododecane are target chemicals.
- (Note 14) Pentachlorophenol and its salts and esters were adopted as target chemicals at the COP7 of the Stockholm convention on Persistent Organic Pollutants, the survey monitored Pentachlorophenol and Pentachloroanisole.

(Note 1) *1: Organisations responsible for sampling are described by their official names in FY2021 (Note 2) *2: Because there were the examples of survey that obtained the eggs in other countries, the eggs of great cormorants were taken in this survey by Water and Air Quality Control Division, Environmental Management Bureau, Agricultural and Environmental Affairs Department, Hyogo Prefectural Government and Green Nature Division, Environmental Policy Office, Department of Citizen Autonomy, Itami City. The results were treated as the reference values. (Note 3) *3: That organization cooperated with a private analytical laboratory in sampling specimens

(2) Monitored sites (areas)

In the Environmental Monitoring (of surface water, sediment, wildlife, and air), the sampling of specimens was entrusted to prefectural governments and government-designated cities across Japan and the specimens sampled were analysed by private analytical laboratories.

The monitored sites (areas) are shown in Table 3-1-1 and Figure 3-1-1 for surface water, Table 3-1-2 and Figure 3-1-2 for sediment, Table 3-1-3 and Figure 3-1-3 for wildlife and Table 3-1-4 and Figure 3-1-4 for air. The breakdown is summarized as follows.

Monitored media	Numbers of local communities	Numbers of target chemicals (groups)	Numbers of monitored sites (or areas)	Numbers of samples at a monitored site (or area)
Surface water	42	11	47	1
Sediment	46	11	60	1^{*1}
Wildlife (bivalves)	3	11	3	1*2
Wildlife (fish)	17	11	18	1*2
Wildlife (birds)	3*3	11	3*3	1*2
Air (warm season)	33*4	11	35	1 or 3*5
All media	57	11	121*3	

(Note 1) *1: For sediment, at each monitoring point, three (3) specimen samples were collected. The target substances were analysed for each place with one (1) specimen sample that is a mixture of equal parts of the three (3) specimen samples.

(Note 2) *2: For wildlife species, at each monitoring point, three (3) specimen samples were collected. The target substances were analysed for each place with one (1) specimen sample that is a mixture of equal parts of the three (3) specimen samples.

(Note 3) *3: Samples obtained in 1 site of the birds as wildlife eggs of Great Cormorant, and the sample was measured each the egg yolk and the egg white, the results were treated as a reference values.

(Note 4) *4: For 1 of the 33 organizations, it was cooperated with a private analytical laboratory in sampling specimens.

(Note 5) *5: The target substances other than [21] Hexachlorobuta-1,3-diene were analysed with one (1) sample for each sit. The target substance [21] Hexachlorobuta-1,3-diene was analysed with the three (3) specimen samples for each site.

(3) Sampling method of specimens

The sampling of specimens and the preparation of samples were carried out following the "Guidelines on Conducting of Environmental Surveys and Monitoring of Chemicals" (published on March 2021) by the Environment Health and Safety Division, Environmental Health Department, Ministry of the Environment of Japan (MOE).

(4) Target species

The species to be monitored among the wildlife media were selected considering the possibility of international comparison, as well as their significance and practicality as indicators: 1 bivalve (blue mussel), 7 fishes (predominantly sea bass), and 1 bird, namely, 9 species in total.

The properties of the species determined as targets in the FY2021 monitoring are shown in Table 3-2. Moreover, Table 3-1-3 summarizes the outline of the samples used for analysis.

Table 3-3-3 Basic data of specimens (birds as wildlife) in the Environmental Monitoring in FY 2021

(Note 1) The great cormorants (immature) killed as harmful birds were used as specimens.

(Note 2) For Great Cormorant, at Riv.Tenjin (Kurayoshi City), two (2) specimen samples were collected. The target substances were analysed for each place with one (1) specimen sample that is a mixture of equal parts of the two (2) specimen samples.

4. Method for regression analysis and testing

The analysis procedure and the evaluation for the analysis result shown in Fig.2 were carried out by the following method.

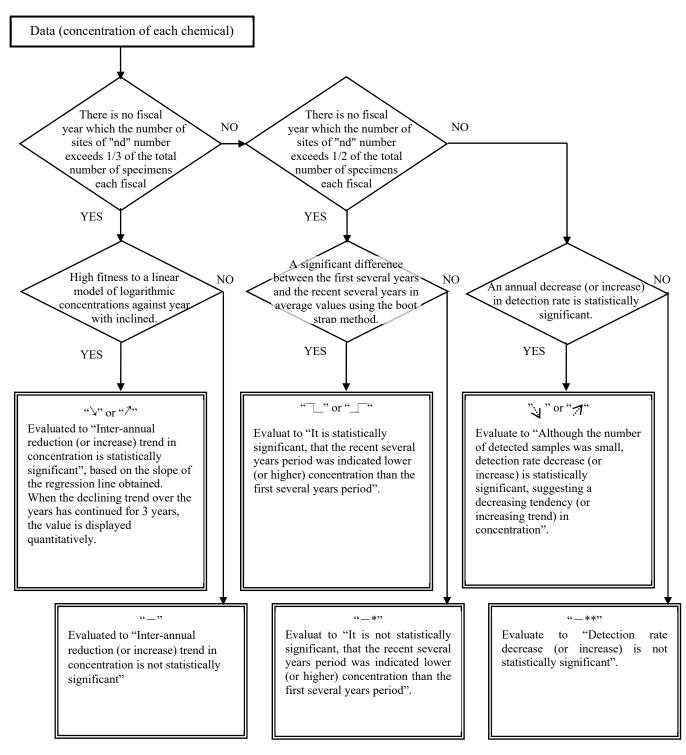

Figure 2 Method for regression analysis and testing

5. Summary of monitoring results

The detection ranges are shown in Table 3-4, and the detection limits are shown in Table 3-5.

The substances which were moniterd FY2021 and past years on the same media, were statistically analysed in order to detect inter-annual trends of increase or decrease. The results of the analyses are shown in Table 3-6

OData were carefully handled on the basis of following points.

• For sediment

At each monitoring point, three (3) specimen samples were collected. And the substances were analysed for each place with one specimen sample that is a mixture of equal parts of the three (3) specimen samples.

• For wildlife

At each monitoring point, three (3) specimen samples were collected in principle. And the substances were analysed for each place with one specimen sample that is a mixture of equal parts of the three (3) specimen samples. • For air

At each monitored site, the sampling was for the monitoring in the warm season (September 27, 2021 \sim November 19, 2021).

Table 3-4-3 List of the detection ranges in the Environmental Monitoring in FY2021	(Part 4)

(Note 1) "Av." indicates the geometric mean calculated by assuming nd (below the detection limit) to be half the value of the detection limit.
(Note 2) "

(Note 3) "tr(X)" indicates that X was below the quantification limit and over the detection limit.
(Note 3) "tr(X)" indicates that X was below the quantification limit and over the detection limit.
(Note 4) Hexachlorobuta-1,3-diene in air was analysed with the three(3) specimen samples for each place. "Range" is based on the concentrations of the samples and "Frequency" is based on the number of sites or areas.
(Note 5) Chlorinated paraffins with 5 ~ 9 chlorines are target chemicals in wildlife, and Chlorinated paraffins with 4 ~ 7 chlorines are target chemicals in air. The results of short-chain chlorinated paraffins are tentative values obtained in trials among various problems in the measurement method. problems in the measurement method.

	[14-7] Decabromodiphenyl ether	
[15]	Perfluorooctane sulfonic acid (PFOS)	Half-life : 18 years [14~27 years]
[16]	Perfluorooctanoic acid (PFOA)	7
[17]	Pentachlorobenzene	-

(Note 1) When the posteriori probability from AICs was more than 95%, the measurement results were deemed to be in agreement with the simple (Note 1) Whith the performing producting from Prices was more than 55%, the measurement results were deemed to be in a log-linear regression model.
 (Note 2) " ↘ ": An inter-annual trend of decrease was found.
 " ↘ ": Statistically significant differences between the first several years and the recent several years were found.

": ": Although the number of detections was small, the detection rate was decreased, it suggested a reduction tendency. "- ": An inter-annual trend was not found.

"-*": In case of using the bootstrap methods, there was not a significant difference between the values of the first several years and the recent several years.

"-**": The detection rate was not decreased, there was not a reduction tendency.

(Note 3) "": The inter-annual trend analysis was not analysed because not conducted the survey in FY2021.

(Note 4) The half-life describes the half-life in the environment based on the survey results when the decrease tendency continues for 3 years or more by the maximum likelihood estimation that does not assume parametric residual distribution. The results in [] indicate that the values in the 95% confidence interval.

(Note 5) Perfluorooctane sulfonic acid (PFOS) and Perfluorooctanoic acid (PFOA): the results of the inter-annual trend analysis from FY2010 to FY2021. Pentachlorobenzene: the results of the inter-annual trend analysis from FY2007 to FY2021.

(Note) There are monitored sites which were classified in the area unlike these names by the situations.

In the wake of the monitoring surveys of FY2002~2021, high-sensitivity analysis of PCBs, and HCB were conducted. All these chemicals were detected.

High-sensitivity analysis of DDTs, Perfluorooctane sulfonic acid (PFOS), Perfluorooctanoic acid (PFOA), Pentachlorobenzene, Endosulfans, Polychlorinated Naphthalenes, Hexachlorobuta-1,3-diene, Short-chain chlorinated paraffins and Perfluorohexane sulfonic acid (PFHxS) were also conducted in FY2021.

Except for cases of undetected Endosulfans in wildlife and Hexachlorobuta-1,3-diene in surface water and wildlife (birs), all chemicals were detected.

The monitoring results for each chemical (group) are described below.

[1] Total PCBs

· History and state of monitoring

Polychlorinated biphenyls (PCBs) were used in industry as heat exchange fluids, etc. and were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in June 1974, since the substances are persistent, highly accumulative in living organisms, and chronically toxic. Also the substances are one of the original twelve POPs covered by the Stockholm Convention.

In previous monitoring series, the substances were monitored in wildlife (bivalves, fish and birds) during the period of FY1978~2001 under the framework of "the Wildlife Monitoring." Under the framework of "The Follow-up Survey of the Status of Pollution by Unintentionally Formed Chemicals," sediment and wildlife (fish) were the monitored media in FY1996 and FY1997, and surface water, sediment, wildlife (fish) and air were the monitored media in FY2000 and FY2001.

Under the framework of the Environmental Monitoring, the substances in surface water, sediment, wildlife (bivalves, fish and birds) and air have been monitored since FY2002.

· Monitoring results

<Surface Water>

The presence of the substances in surface water was monitored at 47 sites, and it was detected at 45 of the 47 valid sites adopting the detection limit of 6pg/L, and the detection range was up to 5,900pg/L.

As results of the inter-annual trend analysis from FY2002 to FY2021, reduction tendencies in specimens from river areas, lake areas and river mouth areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

Total PCBs	Monitored	Geometric				Quantification	Detection	Frequency
(total amount)	year	mean*1	Median	Maximum	Minimum	[Detection] Limit ^{*2}	Sample	Site

	2021	100	81	5,900	nd	16 [6]	45/47	45/47

Stocktaking of the detection of Total PCBs (total amount) in surface water during FY2002~2021

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2002.

(Note 2) *2: The sum value of the Quantification [Detection] limits of each congener

<Sediment>

The presence of the substances in sediment was monitored at 60 sites, and it was detected at all 60 valid sites adopting the detection limit of 2.9 pg/g-dry, and the detection range was $33 \sim 450,000 \text{pg/g-dry}$.

As results of the inter-annual trend analysis from FY2002 to FY2021, reduction tendencies in specimens from river areas and sea areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in sediment was also identified as statistically significant.

Total PCBs	Monitored	Geometric		,	0	Quantification	Detection I	Frequency

Stocktaking of the detection of Total PCBs (total amount) in sediment during FY2002~2021

(Note 1) *1 : Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2002~2009.

(Note 2) 2: The sum value of the Quantification [Detection] limits of each congener

<Wildlife>

The presence of the substances in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 10pg/g-wet, and the detection range was $490 \sim 7,200pg/g$ -wet. For fish, the presence of the substances was monitored in 18 areas, and it was detected at all 18 valid areas adopting the detection limit of 10pg/g-wet, and the detection range was $800 \sim 130,000pg/g$ -wet. For birds, the presence of the substances was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 10pg/g-wet, and the detection areas adopting the detection limit of 10pg/g-wet, and the detected at both valid areas adopting the detection limit of 10pg/g-wet, and the detection range was $110,000 \sim 210,000pg/g$ -wet.

As results of the inter-annual trend analysis from FY2002 to FY2021, reduction tendencies in specimens from bivalves and fish were identified as statistically significant.

Stocktaking of the detection of Total PCBs (total amount) in wildlife (bivalves, fish and birds) during FV2002~2021

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2002~2009.

(Note 2) *2: The sum value of the Quantification [Detection] limits of each congener
 (Note 3) *3: There is no consistency between the results of the ornithological survey after FY2013 and those in previous years because of the changes in the survey sites and target species.

<Air>

The presence of the substances in air was monitored at 35 sites, and it was detected at all 35 valid sites adopting the detection limit of $0.8 pg/m^3$, and the detection range was $17 \sim 340 pg/m^3$.

As a result of the inter-annual trend analysis from FY2003 to FY2021, a reduction tendency in specimens from warm season was identified as statistically significant.

Stocktaking of the detection of Total PCBs (total amount) in air during FY2002~2021

(Note 1) *1: The sum value of the Quantification [Detection] limits of each congener (Note 2) *2: In 2002, there was a technical problem in the measuring method for lowly chlorinated congeners, and therefore the values are shown just as reference.

[2] Hexachlorobenzene

· History and state of monitoring

Hexachlorobenzene was used as pesticidal material and was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in August 1979. Also the substance is one of the original twelve POPs covered by the Stockholm Convention.

In previous monitoring series, the substance was monitored in wildlife (bivalves, fish and birds) during the period of FY1978~1996 and in FY1998, FY2000 and FY2001 under the framework of "the Wildlife Monitoring." Under the framework of "the Surface Water/Sediment Monitoring," the substance in surface water and sediment was monitored during the period of FY1986~1998 and FY1986~2001, respectively.

Under the framework of the Environmental Monitoring, the substance in surface water, sediment, wildlife (bivalves, fish and birds) and air has been monitored since FY2002.

· Monitoring results

<Surface Water>

The presence of the substance in surface water was monitored at 47 sites, and it was detected at all 47 valid sites adopting the detection limit of 0.4 pg/L, and the detection range was $1.6 \sim 180$ pg/L.

As results of the inter-annual trend analysis from FY2002 to FY2021, reduction tendencies in specimens from river areas, lake areas and river mouth areas were identified as statistically significant. The recent 6 years period was indicated lower concentration than the first 6 years period in specimens from sea areas as statistically significant. And a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

Stocktaking of the detection of Hexachlorobenzene in surface water during FY2002~2021

(Note) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2002.

<Sediment>

The presence of the substance in sediment was monitored at 60 sites, and it was detected at all 60 valid sites adopting the detection limit of 0.5 pg/g-dry, and the detection range was $2.5 \sim 12,000 \text{ pg/g-dry}$.

As results of the inter-annual trend analysis from FY2002 to FY2021, reduction tendencies in specimens from river areas and lake areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in sediment was also identified as statistically significant.

Stocktaking of the detection of Hexachlorobenzene in sediment during FY2002~2021

(Note) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.

<Wildlife>

The presence of the substance in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 1pg/g-wet, and the detection range was $tr(2) \sim 26pg/g$ -wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at all 18 valid areas adopting the detection limit of 1pg/g-wet, and the detection range was 24 ~ 950pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 1pg/g-wet, and the detection range was 2,800 ~ 4,200pg/g-wet.

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.

(Note 2) *2: There is no consistency between the results of the ornithological survey after FY2013 and those in previous years because of the changes in the survey sites and target species.

<Air>

The presence of the substance in air was monitored at 35 sites, and it was detected at all 35 valid sites adopting the detection limit of 0.04 pg/m³, and the detection range was $66 \sim 140$ pg/m³.

Stocktaking of the detection of Hexachlorobenzene in air during FY2002~2021

[3] Aldrin (references)

· History and state of monitoring

Aldrin had been used as a soil insecticide until FY1971 when the application of the substance was substantially stopped. Its registration under the Agricultural Chemicals Regulation Law was expired in FY1975. It was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in October 1981. Also the substance is the initial POPs under the Stockholm Convention since 2004.

In previous monitoring series until FY2001, the substance was monitored in wildlife (bivalves, fish and birds) during the period of FY1978~1989, FY1991 and FY1993 under the framework of "the Wildlife Monitoring."

Under the framework of the Environmental Monitoring, the substance had been monitored in surface water, sediment, wildlife (bivalves, fish and birds) and air from FY2002 to FY2009, in wildlife (bivalves, fish and birds) and air in FY2014, in sediment in FY2018.

No monitoring was conducted after FY2019. For reference, the monitoring results up to FY2018 are given below.

Monitoring results until FY2018

<Surface Water>

Stocktaking of the detection of Aldrin in surface water during FY2002~2009

[4] Dieldrin (references)

· History and state of monitoring

Dieldrin was used as a pesticide and its application culminated during the period of 1955~1964. The substance had been used as termitecides as a Soil-Residue-Prone Pesticide under the Agricultural Chemicals Regulation Law in 1971, but its registration under the Agricultural Chemicals Regulation Law was expired in FY1975. It had been used for termite control and was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in October 1981. Also the substance is one of the original twelve POPs covered by the Stockholm Convention.

In previous monitoring series until FY2001, the substance was monitored in wildlife (bivalves, fish and birds) during the period of FY1978~1996, FY1998, FY2000 and FY2001 under the framework of "the Wildlife Monitoring." Under the framework of "the Surface Water/Sediment Monitoring," the substance in surface water and sediment was monitored during the period of FY1986~1998 and FY1986~2001, respectively.

Under the framework of the Environmental Monitoring, the substance had been monitored in surface water, sediment, wildlife (bivalves, fish and birds) and air from FY2002 to FY2009 and in FY2011 and in surface water, wildlife (bivalves, fish and birds) and air in FY2014, in sediment in FY2018.

No monitoring was conducted after FY2019. For reference, the monitoring results up to FY2018 are given below.

Monitoring results until FY2018

<Wildlife>

Stocktaking of the detection of Dieldrin in wildlife (bivalves, fish and birds) during FY2002~2014

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.

(Note 2) *2: There is no consistency between the results of the ornithological survey in FY2014 and those in previous years because of the changes in the survey sites and target species.

(Note 3) No monitoring was conducted in FY2010, FY2012 and FY2013.

(Note) No monitoring was conducted in FY2010, FY2012 and FY2013.

[5] Endrin (references)

· History and state of monitoring

Endrin was used as an insecticide and a rodenticide, but its registration under the Agricultural Chemicals Regulation Law was expired in FY1975. It was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in October 1981. Also the substance is one of the original twelve POPs covered by the Stockholm Convention.

In previous monitoring series until FY2001, the substance was monitored in wildlife (bivalves, fish and birds) during the periods of FY1978~1989 and FY1991~1993 under the framework of "the Wildlife Monitoring".

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water, sediment, wildlife (bivalves, fish and birds) and air from FY2002 to FY2009, and in surface water, wildlife (bivalves, fish and birds) and air in FY2014, in sediment in FY2018.

No monitoring was conducted after FY2019. For reference, the monitoring results up to FY2018 are given below.

Monitoring results until FY2018

[6] DDTs

· History and state of monitoring

DDT, along with hexachlorocyclohexanes (HCHs) and drins, was used as insecticides in high volume. Its registration under the Agricultural Chemicals Regulation Law was expired in FY1971. *p,p'*-DDT was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in October 1981. Also the substances are one of the original twelve POPs covered by the Stockholm Convention.

Among several DDT isomers with chlorine at various positions on the aromatic ring, not only p,p'-DDT and o,p'-DDT as active substances but also p,p'-DDE, o,p'-DDE, p,p'-DDD and o,p'-DDD as the environmentally degraded products of DDTs have been the target chemicals in monitoring series since FY1978.

In previous monitoring series, *p,p'*-DDT, *p,p'*-DDE and *p,p'*-DDD had been monitored in wildlife (bivalves, fish and birds) during the period of FY1978~2001 under the framework of "the Wildlife Monitoring." Under the framework of "the Surface Water/Sediment Monitoring," surface water and sediment had been the monitored media during the period of FY1986~1998 and FY1986~2001, respectively. Similarly, *o,p'*-DDT, *o,p'*-DDE and *o,p'*-DDD had been monitored in wildlife (bivalves, fish and birds) during the period of FY1978~1998, FY2000 and FY2001 under the framework of "the Wildlife Monitoring."

Under the framework of the Environmental Monitoring, *p*,*p*'-DDT, *p*,*p*'-DDE, *p*,*p*'-DDD, *o*,*p*'-DDT, *o*,*p*'-DDE and *o*,*p*'-DDD have been monitored in surface water, sediment, wildlife (bivalves, fish and birds) and air from FY2002 to FY2010, wildlife (bivalves, fish and birds) and air in FY2013, surface water and sediment in FY2014 and air in FY2015, wildlife (bivalves, fish and birds) and air in FY2018, water, sediment, wildlife (bivalves, fish and birds) and air in FY2018, water, sediment, wildlife (bivalves, fish and birds) and air in FY2018, water, sediment, wildlife (bivalves, fish and birds) and air in FY2018, water, sediment, wildlife (bivalves, fish and birds) and air in FY2018, water, sediment, wildlife (bivalves, fish and birds) and air in FY2018, water, sediment, wildlife (bivalves, fish and birds) and air in FY2018, water, sediment, wildlife (bivalves, fish and birds) and air in FY2018, water, sediment, wildlife (bivalves, fish and birds) and air in FY2018, water, sediment, wildlife (bivalves, fish and birds) and air in FY2018, water, sediment, wildlife (bivalves, fish and birds) and air in FY2018, water, sediment, wildlife (bivalves, fish and birds) and air in FY2021.

Monitoring results

\bigcirc *p,p'*-DDT, *p,p'*-DDE and *p,p'*-DDD

<Surface Water>

p,p'-DDT: The presence of the substance in surface water was monitored at 47 sites, and it was detected at 42 of the 47 valid sites adopting the detection limit of 0.3pg/L, and the detection range was up to 190pg/L.

As results of the inter-annual trend analysis from FY2002 to FY2021, reduction tendencies in specimens from lake areas, river mouth areas and sea areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

p,p'-DDE: The presence of the substance in surface water was monitored at 47 sites, and it was detected at all 47 valid sites adopting the detection limit of 0.1 pg/L, and the detection range was $0.9 \sim 170$ pg/L.

As results of the inter-annual trend analysis from FY2002 to FY2021, reduction tendencies in specimens from river areas and sea areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

p,p'-DDD: The presence of the substance in surface water was monitored at 47 sites, and it was detected at all 47 valid sites adopting the detection limit of 0.3 pg/L, and the detection range was $0.9 \sim 87$ pg/L.

As results of the inter-annual trend analysis from FY2002 to FY2021, reduction tendencies in specimens from river areas, lake areas and river mouth areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

(D D D . EX2002 2021

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2002.

(Note 2) No monitoring was conducted during FY2011~2013 and FY2015~2020.

<Sediment>

p,p'-DDT: The presence of the substance in sediment was monitored at 60 sites, and it was detected at all 60 valid sites adopting the detection limit of 0.2pg/g-dry, and the detection range was $3.8 \sim 17,000pg/g$ -dry.

As a result of the inter-annual trend analysis from FY2002 to FY2021, a reduction tendency in specimens from the overall areas in sediment was identified as statistically significant.

p,p'-DDE: The presence of the substance in sediment was monitored at 60 sites, and it was detected at all 60 valid sites adopting the detection limit of 0.3 pg/g-dry, and the detection range was $8.7 \sim 25,000 \text{ pg/g-dry}$.

p,p'-DDD: The presence of the substance in sediment was monitored at 60 sites, and it was detected at all 60 valid sites adopting the detection limit of 0.2 pg/g-dry, and the detection range was $1.9 \sim 8,600$ pg/g-dry.

As results of the inter-annual trend analysis from FY2002 to FY2021, a reduction tendency in specimens from sea areas was identified as statistically significant and a reduction tendency in specimens from the overall areas in sediment was also identified as statistically significant.

Stocktaking of the detection of p, p'-DDT, p, p'-DDE and p, p'-DDD in sediment during FY2002~2021

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.

(Note 2) No monitoring was conducted during FY2011~2013 and FY2015~2020.

<Wildlife>

p,p'-DDT: The presence of the substance in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 2pg/g-wet, and the detection range was $28 \sim 420$ pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 17 of the 18 valid areas adopting the detection limit of 2pg/g-wet, and the detection range was up to 1,500pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 2pg/g-wet, and the detection range was 29 ~ 120pg/g-wet.

As results of the inter-annual trend analysis from FY2002 to FY2021, reduction tendencies in specimens from bivalves and fish were identified as statistically significant.

p,p'-DDE: The presence of the substance in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 1pg/g-wet, and the detection range was 88 ~ 960pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at all 18 valid areas adopting the detection limit of

1pg/g-wet, and the detection range was $230 \sim 8,500pg/g$ -wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 1pg/g-wet, and the detection range was $64,000 \sim 100,000pg/g$ -wet.

As a result of the inter-annual trend analysis from FY2002 to FY2021, a reduction tendency in specimens from bivalves was identified as statistically significant.

p,p'-DDD: The presence of the substance in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 0.9pg/g-wet, and the detection range was $5.2 \sim 840$ pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at all 18 valid areas adopting the detection limit of 0.9pg/g-wet, and the detection range was $26 \sim 2,700$ pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 0.9pg/g-wet, and the detection range was $26 \sim 2,700$ pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 0.9pg/g-wet, and the detection range was $120 \sim 140$ pg/g-wet.

As results of the inter-annual trend analysis from FY2002 to FY2021, reduction tendencies in specimens from bivalves and fish were identified as statistically significant.

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.

(Note 2) *2: There is no consistency between the results of the ornithological survey in FY2013 and those in previous years because of the changes in the survey sites and target species.

(Note 3) No monitoring was conducted in FY2011, FY2012, FY2014~2017, FY2019 and FY2020.

<Air>

p,p'-DDT: The presence of the substance in air was monitored at 35 sites, and it was detected at all 35 valid sites adopting the detection limit of 0.06pg/m^3 , and the detection range was $0.16 \sim 6.3 \text{pg/m}^3$.

As a result of the inter-annual trend analysis from FY2003 to FY2021, a reduction tendency in specimens from warm season was identified as statistically significant.

p,p'-DDE: The presence of the substance in air was monitored at 35 sites, and it was detected at all 35 valid sites adopting the detection limit of 0.05 pg/m³, and the detection range was $0.43 \sim 21$ pg/m³.

As a result of the inter-annual trend analysis from FY2003 to FY2021, a reduction tendency in specimens from warm season was identified as statistically significant.

p,p'-DDD: The presence of the substance in air was monitored at 35 sites, and it was detected at 18 of the 35 valid sites adopting the detection limit of 0.05 pg/m³, and the detection range was up to 0.18 pg/m³.

As a result of the inter-annual trend analysis from FY2003 to FY2021, although the number of detections was small, the detection rate of specimens from warm season was decreased, it suggested a reduction tendency of the concentrations.

\bigcirc *p,p'*-DDT, *p,p'*-DDE and *p,p'*-DDD

<Surface Water>

o,p'-DDT: The presence of the substance in surface water was monitored at 47 sites, and it was detected at 30 of the 47 valid sites adopting the detection limit of 0.3pg/L, and the detection range was up to 33pg/L.

As results of the inter-annual trend analysis from FY2002 to FY2021, reduction tendencies in specimens from river areas and river mouth areas were identified as statistically significant. The recent 6 years period was indicated lower concentration than the first 6 years period in specimens from sea areas as statistically significant. Although the number of detections was small, the detection rate of specimens from lake areas was decreased, it suggested a reduction tendency of the concentrations. And a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

o,p'-DDE: The presence of the substance in surface water was monitored at 47 sites, and it was detected at 32 of the 47 valid sites adopting the detection limit of 0.2pg/L, and the detection range was up to 92pg/L.

As results of the inter-annual trend analysis from FY2002 to FY2021, reduction tendencies in specimens from lake areas and river mouth areas were identified as statistically significant. The recent 6 years period was indicated lower concentration than the first 6 years period in specimens from sea areas as statistically significant. Although the number of detections was small, the detection rate of specimens from river areas was decreased, it suggested a reduction tendency of the concentrations. And the recent 6 years period was also indicated lower concentration than the first 6 years period was also indicated lower concentration than the first 6 years period was also indicated lower concentration than the first 6 years period in specimens from sea areas as statistically significant.

o,p'-DDD: The presence of the substance in surface water was monitored at 47 sites, and it was detected at all 47 valid sites adopting the detection limit of 0.2pg/L, and the detection range was tr(0.3) ~ 54pg/L.

Stocktaking of the detection of o,p'-DDT, o,p'-DDE and o,p'-DDD in surface water during FY2002~2021

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2002.

(Note 2) No monitoring was conducted during FY2011~2013 and FY2015~2020.

<Sediment>

o,p'-DDT: The presence of the substance in sediment was monitored at 60 sites, and it was detected at 58 of the 60 valid sites adopting the detection limit of 0.2pg/g-dry, and the detection range was up to 3,200pg/g-dry.

As results of the inter-annual trend analysis from FY2002 to FY2021, a reduction tendency in specimens from river areas was identified as statistically significant and a reduction tendency in specimens from the overall areas in sediment was also identified as statistically significant.

o,p'-DDE: The presence of the substance in sediment was monitored at 60 sites, and it was detected at 59 of the 60 valid sites adopting the detection limit of 0.2pg/g-dry, and the detection range was up to 16,000pg/g-dry.

o,p'-DDD: The presence of the substance in sediment was monitored at 60 sites, and it was detected at all 60 valid sites adopting the detection limit of 0.2pg/g-dry, and the detection range was $0.4 \sim 2,500$ pg/g-dry.

As results of the inter-annual trend analysis from FY2002 to FY2021, a reduction tendency in specimens from river areas was identified as statistically significant.

Stocktaking of the detection of o,p'-DDT, o,p'-DDE and o,p'-DDD in sediment during FY2002~2021

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.

(Note 2) No monitoring was conducted during FY2011~2013 and FY2015~2020.

<Wildlife>

o,p'-DDT: The presence of the substance in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 1pg/g-wet, and the detection range was $8 \sim 93$ pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at all 18 valid areas adopting the detection limit of 1pg/g-wet, and the detection range was tr(1) ~ 70pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 1pg/g-wet, and the detection range was tr(1) ~ 70pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 1pg/g-wet, and the detection range was tr(1) ~ 3pg/g-wet.

As results of the inter-annual trend analysis from FY2002 to FY2021, reduction tendencies in specimens from bivalves and fish were identified as statistically significant.

o,p'-DDE: The presence of the substance in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 1pg/g-wet, and the detection range was tr(2) ~ 110pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 17 of the 18 valid areas adopting the detection limit

of 1pg/g-wet, and the detection range was up to 1,600pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 1pg/g-wet, and the detection range was $tr(1) \sim tr(1)pg/g$ -wet.

As results of the inter-annual trend analysis from FY2002 to FY2021, reduction tendencies in specimens from bivalves and fish were identified as statistically significant.

o,p'-DDD: The presence of the substance in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 2pg/g-wet, and the detection range was tr(2) ~ 760pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 17 of the 18 valid areas adopting the detection limit of 2pg/g-wet, and the detection range was up to 380pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 2pg/g-wet, and the detection range was tr(4) ~ 8pg/g-wet.

As results of the inter-annual trend analysis from FY2002 to FY2021, a reduction tendency in specimens from bivalves was identified as statistically significant.

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.

(Note2) *2: There is no consistency between the results of the ornithological survey in FY2013 and those in previous years because of the changes in the survey sites and target species.

(Note 3) No monitoring was conducted in FY2011, FY2012, FY2014~2017, FY2019 and 2020.

<Air>

o,p'-DDT: The presence of the substance in air was monitored at 35 sites, and it was detected at all 35 valid sites adopting the detection limit of 0.03pg/m³, and the detection range was $0.11 \sim 3.0$ pg/m³.

As results of the inter-annual trend analysis from FY2003 to FY2021, a reduction tendency in specimens from warm season was identified as statistically significant.

o,p'-DDE: The presence of the substance in air was monitored at 35 sites, and it was detected at 34 of the 35 valid sites adopting the detection limit of 0.04 pg/m³, and the detection range was up to 0.55 pg/m³.

As results of the inter-annual trend analysis from FY2003 to FY2021, a reduction tendency in specimens from warm season was identified as statistically significant.

o,p'-DDD: The presence of the substance in air was monitored at 35 sites, and it was detected at 27 of the 35 valid sites adopting the detection limit of 0.04 pg/m³, and the detection range was up to 0.16 pg/m³.

As results of the inter-annual trend analysis from FY2003 to FY2021, the recent 6 years period was indicated lower concentration than the first 6 years period in specimens from warm season as statistically significant.

Stocktaking of the detection of o,p'-DDT, o,p'-DDE and o,p'-DDD in air during FY2002~2021

(Note) No monitoring was conducted in FY2011, FY2012, FY2014, FY2016, FY2017, FY2019 and FY2020.

[7] Chlordanes (references)

· History and state of monitoring

Chlordane was used as insecticides on a range of agricultural crops, but the registration of Chlordanes under the Agricultural Chemicals Regulation Law was expired in FY1968. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in September 1986 because of its properties such as persistency, since it had been used as termitecides for wood products such as primary processed timber, plywood and house. Also, *cis*-Chlordane and *trans*-Chlordane are one of the original twelve POPs covered by the Stockholm Convention.

Although manufactured Chlordanes have complicated compositions, Heptachlor, γ-Chlordane, Heptachlor epoxide, *cis*-Chlordane, *trans*-Chlordane, Oxychlordane (as a chlordane metabolite), *cis*-Nonachlor (not registrated as an Agricultural Chemical) and *trans*-Nonachlor (not registrated as an Agricultural Chemical) were the original target chemicals in monitoring series. Since FY1983, 5 of those 8 chemicals (*cis*-Chlordane, *trans*-Chlordane, Oxychlordane, *cis*-Nonachlor and *trans*-Nonachlor) have been the target chemicals owning to their high detection frequency in the FY1982 High-Precision Environmental Survey.

In previous monitoring series, Chlordanes had been monitored in wildlife (bivalves, fish and birds) during the period of FY1978~2001 under the framework of "the Wildlife Monitoring." Under the framework of "the Surface Water/Sediment Monitoring", *cis*-Chlordane, *trans*-Chlordane, *cis*-Nonachlor and *trans*-Nonachlor in surface water and sediment have been the monitored during the period of FY1986~1998 and FY1986~2001, respectively.

Under the framework of the Environmental Monitoring, *cis*-Chlordane, *trans*-Chlordane, Oxychlordane (as a Chlordane metabolite), *cis*-Nonachlor (not registrated as an Agricultural Chemical) and *trans*-Nonachlor have been monitored in surface water, sediment, wildlife (bivalves, fish and birds) and air from FY2002~2013, FY2016, FY2017 and FY2020.

No monitoring was conducted in FY2021. For reference, the monitoring results up to FY2020 are given below.

Monitoring results until FY2020

○ *cis*-Chlordane and *trans*-Chlordane

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.
(Note 2) *2: There is no consistency between the results of the ornithological survey after FY2013 and those in previous years because of the changes in the survey sites and target species.
(Note 3) No monitoring was conducted during FY2014, 2015 and FY2017~2019.

	2020			81	81	4 [2]	1/1	1/1

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.

(Note 2) *2: There is no consistency between the results of the ornithological survey after FY2013 and those in previous years because of the changes in the survey sites and target species.
 (Note 3) No monitoring was conducted during FY2014, 2015 and FY2017~2019.

(Note) No monitoring was conducted in FY2014, FY2015 and FY2017~2019.

[8] Heptachlors (references)

· History and state of monitoring

Heptachlor and its metabolite, Heptachlor epoxide, used to kill soil insects and termites, heptachlor has also been used more widely to kill cotton insects, grasshoppers, other crop pests, and malaria-carrying mosquitoes. The substances were not registrated under the Agricultural Chemicals Regulation Law in FY1975. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in September 1986, since it includes the technical chlordane used as a termitecide. Also Heptachlors are one of the original twelve POPs covered by the Stockholm Convention.

In previous monitoring series before FY2001, Heptachlor and Heptachlor epoxide were measured in FY1982 (in surface water, sediment and fish) and in FY1986 (in air) under the framework of "the Environmental Survey and Monitoring of Chemicals."

Under the framework of the Environmental Monitoring, Heptachlor in surface water, sediment, wildlife (bibalves, fish and birds) and air had been monitored since FY2002, and *cis*-Heptachlor epoxide and *trans*-Heptachlor epoxide had also been monitored since FY2003. After FY2012, the substances has been monitored in sediment, wildlife (bivalves, fish and birds) and air in FY2012, FY2013, FY2015 and FY2016 and in surface water and sediment in FY2014, FY2017 and FY2020.

No monitoring was conducted in FY2021. For reference, the monitoring results up to FY2020 are given below.

• Monitoring results until FY2020

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.

(Note 2) No monitoring was conducted in FY2012, 2013, FY2015, FY2016, FY2018 and FY2019.

<Wildlife>

Stocktaking of the detection of Heptachlor, *cis*-Heptachlor epoxide and *trans*-Heptachlor epoxide in wildlife (bivalves, fish and birds) during FY2002~2020

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.

(Note 2) *2: There is no consistency between the results of the ornithological survey after FY2013 and those in previous years because of the changes in the survey sites and target species.

(Note 3) No monitoring was conducted in FY2014 and FY2017~2019.

<Air>

Stocktaking of the detection of Heptachlor, *cis*-Heptachlor epoxide and *trans*-Heptachlor epoxide in air during FY2002~2020

(Note) No monitoring was conducted in FY2014 and FY2017~2019.

[9] Toxaphenes (references)

· History and state of monitoring

Toxaphenes are a group of organochlorine insecticides used on cotton, cereal grains, fruits, nuts, and vegetables and also it has also been used to control ticks and mites in livestock. No domestic record of manufacture/import of the substances was reported since those were historically never registrated under the Agricultural Chemicals Regulation Law. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in September 2002. Also, Toxaphenes are one of the original twelve POPs covered by the Stockholm Convention.

In previous monitoring series before FY2001, total amount of Toxaphenes was measured in FY1983 (in surface water and sediment) under the framework of "the Environmental Survey and Monitoring of Chemicals."

Under the framework of the Environmental Monitoring, Parlar-26, Parlar-50 and Parlar-62 have been monitored in surface water, sediment, wildlife (bivalves, fish and birds) and air from FY2003 to FY2009 and in wildlife (bivalves, fish and birds) in FY2015, in surface water, sediment, wildlife (bivalves, fish and birds) and air from FY2018.

No monitoring was conducted after FY2019. For reference, the monitoring results up to FY2018 are given below.

Monitoring results until FY2018

<Sediment>

Stocktaking of the detection	of Parlar-26, Parlar-50 and Parlar-62	in sediment during FY2003~2018

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2003~2009. (Note 2) No monitoring was conducted in FY2010~2017.

<Wildlife>

Stocktaking of the detection of Parlar-26, Parlar-50 and Parlar-62 in wildlife (bivalves, fish and birds) during FY2003~2018

(Note) No monitoring was conducted in FY2010~2017.

[10] Mirex (references)

· History and state of monitoring

Mirex was developed as an organochlorine insecticide chemical in the United States, and it was also used as a fire retardant in plastics, rubber, and electrical goods. No domestic record of manufacture/import of the substance was reported since it was historically never registrated under the Agricultural Chemicals Regulation Law. The substance was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in September 2002. Also the substance is one of the original twelve POPs covered by the Stockholm Convention.

Before FY2001, the substance was measured in FY1983 (in surface water and sediment) under the framework of "the Environmental Survey and Monitoring of Chemicals."

Under the framework of the Environmental Monitoring, Mirex has been monitored in surface water, sediment, wildlife (bivalves, fish and birds) and air in FY2003~2009, FY2011 and FY2018.

No monitoring was conducted after FY2019. For reference, the monitoring results up to FY2018 are given below.

Monitoring results until FY2018

<Surface Water>

(Note) No monitoring was conducted in FY2010 and FY2012~2017.

[11] HCHs (references)

· History and state of monitoring

HCHs were used as pesticides, household insecticides, and termiticides, etc. Even after their registration under the Agricultural Chemicals Regulation Law was expired in FY1971, they continue to be used as termiticides and wood preservatives. α -HCH, β -HCH, and γ -HCH (synonym: Lindane) were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants in May 2009. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010.

Among many HCH isomers, α -HCH, β -HCH, γ -HCH (synonym: Lindane) and δ -HCH have been monitored in surface water, sediment, wildlife (bivalves, fish and birds) and air.

Before FY2001, the substances were measured in FY1974 (in surface water, sediment and fish) under the framework of "the Environmental Survey and Monitoring of Chemicals." α -HCH and β -HCH had been the target chemicals, and surface water and sediment had been the monitored media during the period of FY1986~1998 and FY1986~2001, respectively. Under the framework of the Wildlife Monitoring, the substances were monitored in wildlife (bivalves, fish and birds) during the period of FY1978~1996 and in FY1998, FY2000 and FY2001 (γ -HCH (synonym: Lindane) and δ -HCH had not been monitored since FY1997 and FY1993, respectively.)

Under the framework of the Environmental Monitoring, α -HCH and β -HCH in surface water, sediment, and wildlife (bivalves, fish and birds) have been monitored since FY2002, except FY2018. α -HCH and β -HCH in air and γ -HCH (synonym: Lindane) and δ -HCH in surface water, sediment, wildlife (bivalves, fish and birds) and air have also been monitored since FY2003, except FY2018.

No monitoring was conducted in FY2020. For reference, the monitoring results up to FY2019 are given below.

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2002~2009. (Note 2) *2: There is no consistency between the results of the ornithological survey after FY2013 and those in previous years

because of the changes in the survey sites and target species.

(Note 3) No monitoring was conducted in FY2018.

<Air>

Stocktaking of the detection of α -HCH.	β -HCH. γ -HCH	(svnonvm: Lindane) and δ -HCH in air during FY2002~2019

(Note) No monitoring was conducted in FY2018.

[12] Chlordecone (reference)

• History and state of monitoring (reference)

Chlordecone is a synthetic chlorinated organic compound, which was mainly used as an agricultural pesticide. No domestic record of manufacture/import of the substance was reported since it was historically never registrated under the Agricultural Chemicals Regulation Law. Chlordecone was adopted as a target chemical at the Fourth Meeting of the Conference of Parties (COP4) on Stockholm convention on Persistent Organic Pollutants in May 2009 and designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010.

As a continuous survey, the first survey was in FY2008. In the Initial Environmental Survey and the Detailed Environmental Survey etc. under the framework of the Environmental Survey and Monitoring of Chemicals after FY2002, the substance was monitored in air in FY2003.

Under the framework of the Environmental Monitoring, the substance was monitored in surface water, sediment and wildlife (bivalves, fish and birds) in FY2008, and in surface water, sediment and wildlife (bivalves, fish and birds) air in FY2010 and FY2011.

No monitoring was conducted after FY2012. For reference, the monitoring results up to FY2011 are given below.

Monitoring results until FY2011

<Surface Water>

Stocktaking of the detection of Chlordecone in surface water during FY2008~2011

[13] Hexabromobiphenyls (reference)

· History and state of monitoring

Hexabromobiphenyls are industrial chemicals that have been used as flame retardans. Hexabromobiphenyls were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants in May 2009 and designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010.

As a continuous survey, the first survey was in FY2009. Under the framework of the Environmental Survey of Chemical Substances up to FY2001, the substance was monitored in surface water, sediment, wildlife (fish) and air in FY1989. Under the framework of the Initial Environmental Survey and the Detailed Environmental Survey etc. in the Environmental Survey and Monitoring of Chemicals after FY2002, the substance was monitored surface water and sediment in FY2003, in air in FY2004.

Under the framework of the Environmental Monitoring, the substances were monitored in surface water, sediment and wildlife (bivalves, fish and birds) in FY2009, in air in FY2010~2011 and in sediment, wildlife (bivalves, fish and birds) and air in FY2015.

No monitoring was conducted after FY2016. For reference, the monitoring results up to FY2015 are given below.

Monitoring results until FY2015

<Surface Water>

Stocktaking of the detection of Hexabromobiphenyls in surface water during FY2009~2011

	Monitored	Geometric				Quantification	Detection I	Frequency

Stocktaking of the detection of Hexabromobiphenyls in wildlife (bivalves, fish and birds) during FY2009~2015

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2009.

(Note 2) *2: The sum value of the Quantification [Detection] limits of each congener in FY2009 and FY2010.

(Note 3) *3: There is no consistency between the results of the ornithological survey in FY2015 and those in previous years because of the changes in the survey sites and target species.

(Note 4) No monitoring was conducted during FY2012~2014.

<Air>

Stocktaking of the detection of Hexabromobiphenyls in air during FY2010~2015

[14] Polybromodiphenyl ethers (Br₄~Br₁₀) (reference)

· History and state of monitoring

Polybrominated diphenyl ethers have been used as flame retardants for plastics products. Tetrabromodiphenyl ethers, Pentabromodiphenyl ethers, Hexabromodiphenyl ethers, and Heptabromodiphenyl ethers were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants in May 2009. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010. Also, Decabromodiphenyl ether was adopted as target chemicals at the COP8 of the Stockholm convention on Persistent Organic Pollutants held from late April to early May 2017. The substance was designated as a Class I Specified Chemical Substances Control Law in April 2018.

As a continuous survey, the first survey was in FY2008. Under the framework of the Environmental Survey of Chemical Substances up to FY2001, Decabromodiphenyl ether was monitored in surface water and sediment in FY1977 and FY1996, Polybromodiphenyl ethers (Br_6 , Br_8 and Br_{10}) were monitored in surface water, sediment and wildlife (fish) in FY1987 and FY1988, Polybromodiphenyl ethers ($Br_1 \sim Br_7$) were monitored in air in FY2001. In the Initial Environmental Survey and the Detailed Environmental Survey etc. under the framework of the Environmental Survey and Monitoring of Chemicals after FY2002, Decabromodiphenyl ether was monitored in surface water, sediment and wildlife (fish) in FY2002, Polybromodiphenyl ethers (Br_6 , Br_8 and Br_{10}) were monitored in sediment and wildlife (fish) in FY2003, Pentabromodiphenyl ethers were monitored in sediment and Polybromodiphenyl ethers ($Br_1 \sim Br_7$) in air in FY2004, Polybromodiphenyl ethers ($Br_1 \sim Br_7$, Br_9 and Br_{10}) were monitored in surface water in FY2005.

Under the framework of the Environmental Monitoring, Polybromodiphenyl ethers (Br₄~Br₁₀) were monitored in wildlife (bivalves, fish and birds) in FY2008, in surface water, sediment and air in FY2009 and in surface water, sediment and wildlife (bivalves, fish and birds) and air in FY2010~2012, 2014~2019.

No monitoring was conducted after FY2020. For reference, the monitoring results up to FY2019 are given below.

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2009.

(Note 2) No monitoring was conducted in FY2013.

<Wildlife>

Stocktaking of the detection of Polybromodiphenyl ethers $(Br_4 \sim Br_{10})$ in wildlife (bivalves, fish and birds) during FY2008~2019

- (Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2008.
- (Note 2) *2: There is no consistency between the results of the ornithological survey after FY2014 and those in previous years because of the changes in the survey sites and target species.
 (Note 3) No monitoring was conducted in FY2009 and FY2013.

<Air>

Stocktaking of the detection of Pol	vbromodiphenvl ethers	(Br ₄ ~Br ₁₀) in air during FY2008~2019
Stocktaking of the detection of 1 of	y or official priority reducts	(D14 D110) m an daming 1 1 2000 2017

[15] Perfluorooctane sulfonic acid (PFOS)

· History and state of monitoring

Perfluorooctane sulfonic acid (PFOS) has been used as electric and electronic parts, fire fighting foam, photo imaging, hydraulic fluids and textiles. Perfluorooctane sulfonic acid, its salts and perfluorooctane sulfonyl fluoride were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants in May 2009, and designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010.

As a continuous survey, the first survey was in FY2008. Under the framework the Initial Environmental Survey and the Detailed Environmental Survey etc. in the Environmental Survey and Monitoring of Chemicals after FY2002, the substance was monitored in surface water in FY2002, sediment and wildlife (fish) in FY2003, air in FY2004, surface water, sediment and wildlife (bivalves and fish) in FY2005.

Under the framework of the Environmental Monitoring, the substance was monitored in surface water and sediment in FY2009~2012, FY2014~2016, and FY2018~2020, in wildlife (bivalves, fish and birds) in FY2009~2012, FY2014~2017, FY2019 and FY2020, in air in FY2010~2012, FY2014~2017 and FY2019surface water, sediment, wildlife (bivalves, fish and birds) and air in FY2010~2017 and FY2019~2021.

• Monitoring results

<Surface Water>

The presence of the substance in surface water was monitored at 47 sites, and it was detected at all 47 valid sites adopting the detection limit of 30 pg/L, and the detection range was tr(30) ~ 3,700 pg/L.

As results of the inter-annual trend analysis from FY2009 to FY2021, a reduction tendency in specimens from lake areas was identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

Stocktaking of the detection of Perfluorooctane sulfonic acid (PFOS) in surface water during FY2009~2021

(Note) No monitoring was conducted in FY2013 and FY2017.

<Sediment>

The presence of the substance in sediment was monitored at 60 sites, and it was detected at all 60 valid sites adopting the detection limit of 3pg/g-dry, and the detection range was tr(5) ~ 620pg/g-dry.

As results of the inter-annual trend analysis from FY2009 to FY2021, reduction tendencies in specimens from river mouth areas and sea areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in sediment was also identified as statistically significant.

Stocktaking of the detection of Perfluorooctane sulfonic acid (PFOS) in sediment during FY2009~2021

	2021	52	62	620	tr(5)	6 [3]	60/60	60/60

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2009.

(Note 2) No monitoring was conducted in FY2013.

<Wildlife>

The presence of the substance in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 2pg/g-wet, and the detection range was tr(2) ~ 250pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at all 18 valid areas adopting the detection limit of 2pg/g-wet, and the detection range was tr(2) ~ 4,500pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 2pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 2pg/g-wet, and the detection range was 590 ~ 15,000pg/g-wet.

As a result of the inter-annual trend analysis from FY2009 to FY2021, although the number of detections was small, the detection rate of specimens from the bivalves was decreased, it suggested a reduction tendency of the concentrations.

	2021	3,000		15,000	590	5 [2]	2/2	2/2

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2009.

(Note 2) *2: There is no consistency between the results of the ornithological survey after FY2014 and those in previous years because of the changes in the survey sites and target species.

(Note 3) No monitoring was conducted in FY2013 and FY2018.

<Air>

The presence of the substance in air was monitored at 35 sites, and it was detected at all 35 valid sites adopting the detection limit of 0.07pg/m^3 , and the detection range was $0.70 \sim 6.5 \text{pg/m}^3$.

As a result of the inter-annual trend analysis from FY2010 to FY2021, a reduction tendency in specimens from warm season was identified as statistically significant.

[16] Perfluorooctanoic acid (PFOA)

· History and state of monitoring

Perfluorooctanoic acids (PFOA) have been used as water repellent agent, oil repellent agent and surface acting agent. PFOA, its salts and PFOA-related compounds were adopted as target chemicals at the COP9 of the Stockholm convention on Persistent Organic Pollutants held from late April to early May 2019. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2021.

As a continuous survey, the first survey was in FY2009. Under the framework of the Environmental Survey and Monitoring of Chemicals after FY2002, the Initial Environmental Survey and the Detailed Environmental Survey etc., the substance was monitored in surface water in FY2002, sediment and wildlife (fish) in FY2003, air in FY2004, surface water, sediment and wildlife (bivalves and fish) in FY2005.

Under the framework of the Environmental Monitoring, the substance was monitored in surface water and sediment in FY2009~2012, FY2014~2016, and FY2018~2020, in wildlife (bivalves, fish and birds) in FY2009~2012, FY2014~2017, FY2019 and FY2020, in air in FY2010~2012, FY2014~2017 and FY2019surface water, sediment, wildlife (bivalves, fish and birds) and air in FY2010~2017 and FY2019~2021.

• Monitoring results

<Surface Water>

The presence of the substance in surface water was monitored at 47 sites, and it was detected at all 47 valid sites adopting the detection limit of 40pg/L, and the detection range was $230 \sim 23,000$ pg/L.

As results of the inter-annual trend analysis from FY2009 to FY2021, reduction tendencies in specimens from river areas, lake areas and river mouth areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

Stocktaking of the detection of Perfluorooctanoic acid (PFOA) in surface water during FY2009~2021

(Note) No monitoring was conducted in FY2013 and FY2017.

<Sediment>

The presence of the substance in sediment was monitored at 60 sites, and it was detected at 58 of the 60 valid sites adopting the detection limit of 4pg/g-dry, and the detection range was up to 260pg/g-dry.

As results of the inter-annual trend analysis from FY2009 to FY2021, a reduction tendencies in specimens from river mouth areas was identified as statistically significant and a reduction tendency in specimens from the overall areas in sediment was also identified as statistically significant.

Stocktaking of the detection of Perfluorooctanoic acid (PFOA) in sediment during FY2009~2021

Perfluorooctanoic	Monitored	Geometric				Quantification	Detection l	Frequency
acid (PFOA)	year	mean*	Median	Maximum	Minimum	[Detection] limit	Sample	Site
	2009	27	24	500	nd	8.3 [3.3]	182/190	64/64

(pg/g-dry)	2016	27	27	190	nd	9 [4]	61/62	61/62
	2018	23	25	190	nd	9 [4]	58/61	58/61
	2019	21	22	190	tr(3)	5 [2]	61/61	61/61
	2020	21	22	190	nd	8 [3]	57/58	57/58
	2021	24	26	260	nd	9 [4]	58/60	58/60

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2009.

(Note 2) No monitoring was conducted in FY2013 and FY2017.

<Wildlife>

The presence of the substance in bivalves was monitored in 3 areas, and it was detected at 2 of the 3 valid areas adopting the detection limit of 2pg/g-wet, and the detection range was up to 16pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 14 of the 18 valid areas adopting the detection limit of 2pg/g-wet, and the detection range was up to 40pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 2pg/g-wet, and the detected at both valid areas adopting the detection limit of 2pg/g-wet, and the detected at both valid areas adopting the detection limit of 2pg/g-wet, and the detection range was $46 \sim 410pg/g$ -wet.

As results of the inter-annual trend analysis from FY2009 to FY2021, although the number of detections was small, the detection rates of specimens from bivalves and fish were decreased, it suggested reduction tendencies of the concentrations.

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2009.

(Note 2) *2: There is no consistency between the results of the ornithological survey after FY2014 and those in previous years because of the changes in the survey sites and target species.

(Note 3) No monitoring was conducted in FY2013 and FY2018.

<Air>

The presence of the substance in air was monitored at 35 sites, and it was detected at all 35 valid sites adopting the detection limit of 0.3 pg/m³, and the detection range was $2.6 \sim 42$ pg/m³.

As a result of the inter-annual trend analysis from FY2010 to FY2021, a reduction tendency in specimens from warm season was identified as statistically significant.

(Note) No monitoring was conducted in FY2018.

[17] Pentachlorobenzene

· History and state of monitoring

Pentachlorobenzene have been used as used in PCB products, in dyestuff carriers, as a fungicide, a flame retardant and as a chemical intermediate e.g. previously for the production of quintozene. PeCB might still be used as an intermediate. PeCB is also produced unintentionally during combustion, thermal and industrial processes. It also present as impurities in products such as solvents or pesticides. It was historically never registered under the Agricultural Chemicals Regulation Law. The substance is produced as a by-product when agricultural chemicals are produced. In addition, it is generated unintentionally at the time of combustion. The substance was adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants in May 2009 and designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010.

As a continuous survey to FY2001, undert the framework "the Wildlife Monitoring of Chemicals," the substance was monitored in wildlife (bivalves and fish) in FY1980, wildlife (bivalves, fish and birds) from FY1979 to FY1986, in FY1988, FY1990, FY1992, FY1996 and FY1999.

Under the framework of the Environmental Monitoring, the substance was monitored in surface water in FY2007, FY2010~2015 and FY2017~2021, in sediment and wildlife (bivalves, fish and birds) in FY2007 and FY2010~2021, in air in FY2007, FY2009~2021.

· Monitoring results

<Surface Water>

The presence of the substance in surface water was monitored at 47 sites, and it was detected at all 47 valid sites adopting the detection limit of 0.4 pg/L, and the detection range was $1.2 \sim 140$ pg/L.

As a result of the inter-annual trend analysis from FY2010 to FY2021, a reduction tendency in specimens from river areas was identified as statistically significant.

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2007.

(Note 2) No monitoring was conducted in FY2008 and FY2009.

<Wildlife>

The presence of the substance in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 1pg/g-wet, and the detection range was $4 \sim 15$ pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 16 of the 18 valid areas adopting the detection limit of 1pg/g-wet, and the detection range was up to 150pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 1pg/g-wet, and the detection range was 300 ~ 470 pg/g-wet.

As results of the inter-annual trend analysis from FY2010 to FY2021, although the number of detections was small, the detection rate of specimens from the bivalves was decreased, it suggested a reduction tendency of the concentrations.

	2021	380		470	300	4 [1]	2/2	2/2

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2007.

(Note 2) *2: There is no consistency between the results of the ornithological survey after FY2013 and those in previous years because of the changes in the survey sites and target species.

(Note 3) No monitoring was conducted in FY2008 and FY2009.

<Air>

The presence of the substance in air was monitored at 35 sites, and it was detected at all 35 valid sites adopting the detection limit of 0.05 pg/m^3 , and the detection range was $36 \sim 130 \text{ pg/m}^3$.

Stocktaking of the detection of Pentachlorobenzene in air during FY2007~2021

(Note) No monitoring was conducted in FY2008.

[18] Endosulfans

· History and state of monitoring

Endosulfans had been used an insecticide that has been used since the 1950s to control crop pests, tsetse flies and ectoparasites of cattle and as a wood preservative. Endosulfans were adopted as target chemicals at the COP5 of the Stockholm convention on Persistent Organic Pollutants in Apri 2011. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in May 2014.

As a continuous survey, the first survey was in FY2011, under the framework of the Environmental Survey of Chemical Substances up to FY2001, the substance was monitored in surface water and sediment in FY1982 and air in FY1996.

Under the framework of the Environmental Monitoring, the substances were monitored in surface water, sediment, wildlife (bivalves, fish and birds) and air in FY2011 and FY2012, in wildlife (bivalves, fish and birds) and air in FY2014 and FY2015 and in air in FY2016, in surface water, sediment in FY2018 and in surface water, sediment, wildlife (bivalves, fish and birds) and air in FY2021.

Monitoring results

<Surface Water>

 α -Endosulfan: The presence of the substance in surface water was monitored at 47 sites, and it was detected at 17 of the 47 valid sites adopting the detection limit of 40pg/L, and the detection range was up to 580pg/L.

 β -Endosulfan: The presence of the substance in surface water was monitored at 47 sites, and it was detected at 11 of the 47 valid sites adopting the detection limit of 10pg/L, and the detection range was up to 250pg/L.

Stocktaking of the detection of α -Endosulfan and β -Endosulfan in surface water during FY2011~2021

(Note) No monitoring was conducted in FY2013~2017, FY2019 and FY2020.

<Sediment>

 α -Endosulfan: The presence of the substance in sediment was monitored at 60 sites, and it was detected at 50 of the 60 valid sites adopting the detection limit of 0.6pg/g-dry, and the detection range was up to 53pg/g-dry.

 β -Endosulfan: The presence of the substance in sediment was monitored at 60 sites, and it was detected at 12 of the 60 valid sites adopting the detection limit of 0.9pg/g-dry, and the detection range was up to 57pg/g-dry.

(Note) No monitoring was conducted in FY2013~2017, FY2019 and FY2020.

<Wildlife>

 α -Endosulfan: The presence of the substance in bivalves was monitored in 3 areas, and it was not detected at all 3 valid areas adopting the detection limit of 20pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was not detected at all 18 valid areas adopting the detection limit of 20pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was not detected at both valid areas adopting the detection limit of 20pg/g-wet.

 β -Endosulfan: The presence of the substance in bivalves was monitored in 3 areas, and it was not detected at all 3 valid areas adopting the detection limit of 6pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was not detected at all 18 valid areas adopting the detection limit of 6pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was not detected at both valid areas adopting the detection limit of 6pg/g-wet.

[19] 1,2,5,6,9,10-Hexabromocyclododecanes (reference)

· History and state of monitoring

1,2,5,6,9,10-Hexabromocyclododecanes have been used a flame retardant additive, providing fire protection during the service life of vehicles, buildings or articles, as well as protection while stored. α -1,2,5,6,9,10-Hexabromocyclododecane, β -1,2,5,6,9,10-Hexabromocyclododecane and γ -1,2,5,6,9,10-Hexabromocyclododecane were adopted as target chemicals at the COP6 of the Stockholm convention on Persistent Organic Pollutants held from late April to early May 2013, and designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in May 2014.

As a continuous survey, the first survey was in FY2011, under the framework of the Environmental Survey of Chemical Substances up to FY2001, the substances were monitored in surface water, sediment and wildlife (fish) in FY1987. In the framework of the Environmental Survey and Monitoring of Chemicals after FY2002 under the Initial Environmental Survey and the Detailed Environmental Survey etc., the substance was monitored in surface water and sediment in FY2003, in wildlife (fish) in FY2004.

Under the framework of the Environmental Monitoring, α -1,2,5,6,9,10-Hexabromocyclododecane, β -1,2,5,6,9,10-Hexabromocyclododecane, γ -1,2,5,6,9,10-Hexabromocyclododecane, δ -1,2,5,6,9,10-Hexabromo cyclododecane and ϵ -1,2,5,6,9,10-Hexabromocyclododecan have been monitored in surface water, sediment and wildlife (bivalves, fish and birds) in FY2011, in sediment, wildlife (bivalves, fish and birds) and air in FY2012, surface water, wildlife (bivalves, fish and birds) and air in FY2014 and in sediment, wildlife (bivalves, fish and birds) and air in FY2015. And α -1,2,5,6,9,10-Hexabromocyclododecane, β -1,2,5,6,9,10-Hexabromocyclododecane and γ -1,2,5,6,9,10-Hexabromocyclododecane have been monitored in sediment, wildlife (bivalves, fish and birds) and air in FY2016 in wildlife (bivalves, fish and birds) and air in FY2017 in wildlife (bivalves, fish and birds) in FY2018 in wildlife (bivalves, fish and birds) and air in FY2019.

No monitoring was conducted after FY2020. For reference, the monitoring results up to FY2019 are given below.

Stocktaking of the detection of 1,2,5,6,9,10-Hexabromocyclododecanes in sediment during FY2011~2016

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2011.

(Note 2) No monitoring was conducted in FY2013 and FY2014. No monitoring of δ -1,2,5,6,9,10-Hexabromocyclododecane and ε -1,2,5,6,9,10-Hexabromocyclododecane was conducted in FY2016.

<Wildlife>

Stocktaking of the detection of 1,2,5,6,9,10-Hexabromocyclododecanes in wildlife (bivalves, fish and birds) during FY2011~2019

[20] Total Polychlorinated Naphthalenes (Total PCNs)

· History and results of the monitoring

Polychlorinated Naphthalenes (PCNs) make effective insulating coatings for electrical wires and have been used as wood preservatives, as rubber and plastic additives, for capacitor dielectrics and in lubricants. The substances with over 3 chloric ions were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in August 1979. And PCNs (Cl₂~Cl₈) was adopted as target chemicals at the COP7 of the Stockholm convention on Persistent Organic Pollutants in May 2015 and Dichloronaphthalene designated as a Class I Specified Chemical Substance under the Chemical Substance Scontrol Law in August 1979.

In previous monitoring series, Polychlorinated Naphthalenes were monitored in wildlife (bivalves, fish and birds) during the period of FY1980~1985 FY1987 FY 1989 FY 1991 and FY 1993 under the framework of "the Wildlife Monitoring."

Under the framework of "the Environmental Monitoring", Polychlorinated Naphthalenes with over a chloric ions have been monitored in wildlife (bivalves, fish and birds) in FY 2006, in surface water, sediment, wildlife (bivalves, fish and birds) and air in FY2008, in air in FY2014, in wildlife (bivalves, fish and birds) in FY2015 and in sediment, wildlife (bivalves, fish and birds) and air in FY2016~2017, in surface water, sediment, wildlife (bivalves, fish and birds) and air in FY2018, FY2019 and FY2021.

· Monitoring results

<Surface Water>

The presence of the substances in surface water was monitored at 47 sites, and it was detected at 29 of the 47 valid sites adopting the detection limit of 6pg/L, and the detection range was up to 170pg/L.

[21] Hexachlorobuta-1,3-diene

· History and results of the monitoring

Hexachlorobuta-1,3-diene had been used as a solvent for other chlorine-containing compounds. The substance was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law on April 2005. The substance was adopted as target chemicals at the COP7 of the Stockholm convention on Persistent Organic Pollutants in May 2015.

As a continuous survey, the first survey was in FY2007, under the framework of the Environmental Survey of Chemical Substances up to FY2002, the substance was monitored in surface wate and sediment in FY1981, under the framework of the Environmental Survey and Monitoring of Chemicals after FY2002, in the Initial Environmental Survey and the Detailed Environmental Survey etc., the substance was monitored in surface water and sediment in FY2007.

Under the framework of the Environmental Monitoring, the substances have been monitored in surface water sediment and wildlife (bivalves, fish and birds) in FY2007, FY2013, FY2020 and FY2021, and in air in FY2015~2021.

· Monitoring results

<Surface Water>

The presence of the substance in surface water was monitored at 47 sites, and it was not detected at all 47 valid sites adopting the detection limit of 70pg/L.

[22] Pentachlorophenol and its salts and esters (reference)

· History and state of monitoring

Pentachlorophenol was used as a herbicide, insecticide, fungicide, algaecide, disinfectant and as an ingredient in antifouling paint. Pentachlorophenol and its salts and esters were adopted as target chemicals at the COP7 of the Stockholm convention on Persistent Organic Pollutants in May 2015, and designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in Octorber 2016.

As a continuous survey, the first survey of Pentachlorophenol was in FY2015, under the framework of the Environmental Survey of Chemical Substances up to FY2007, the substance was monitored in surface water and sediment in FY1974 and FY1996, and under the framework of the Environmental Survey and Monitoring of Chemicals after FY2002, in the Initial Environmental Survey and the Detailed Environmental Survey etc., the substance was monitored in surface water in FY2005.

Under the framework of the Environmental Monitoring, Pentachlorophenol was monitored in surface water in FY2015. And Pentachlorophenol and Pentachloroanisole were monitored in wildlife (bivalves, fish and birds) and air in FY2016, in surfacewater, sediment, wildlife (bivalves, fish and birds) and air in FY2017~2019.

No monitoring was conducted after FY2020. For reference, the monitoring results up to FY2019 are given below.

Monitoring results until FY2019

[23] Short-chain chlorinated paraffins

· History and state of monitoring

Short-chain chlorinated paraffinsare are used primarily in metalworking applications and in polyvinyl chloride (PVC) plastics. Other uses are adhesives and sealants, leather fat liquors, plastics, and as flame retardants in rubber, textiles and polymeric materials. The substances were adopted as target chemicals at the COP8 of the Stockholm convention on Persistent Organic Pollutants in April-May 2017.

Under the framework of the Initial Environmental Survey and the Detailed Environmental Survey etc., the substances were surveied in surface water, sediment and wildlife (fish) in FY2004 and in surface water, sediment and wildlife (bivalves and fish) in FY2005.

Under the framework of the Environmental Monitoring, the substances have been monitored in wildlife (bivalves, fish and birds) and air in FY2016, and in surface water, sediment, wildlife (bivalves, fish and birds) and air in FY2017~2021.

The results of short-chain chlorinated paraffins are tentative values obtained in trials among various problems in the measurement method.

· Monitoring results

<Surface water>

Chlorinated decanes: The presence of the substance in surface water was monitored at 47 sites, and it was detected at 42 of the 47 valid sites adopting the detection limit of 300pg/L, and the detection range was up to 1,100pg/L.

Chlorinated undecanes: The presence of the substance in surface water was monitored at 47 sites, and it was detected at 26 of the 47 valid sites adopting the detection limit of 300pg/L, and the detection range was up to 1,200pg/L.

Chlorinated dodecanes: The presence of the substance in surface water was monitored at 47 sites, and it was detected at 13 of the 47 valid sites adopting the detection limit of 500pg/L, and the detection range was up to 4,900pg/L.

Chlorinated tridecanes: The presence of the substance in surface water was monitored at 47 sites, and it was detected at 7 of the 47 valid sites adopting the detection limit of 800pg/L, and the detection range was up to 8,600pg/L.

(Note) Chlorinated paraffins with 5~9 chlorines are target chemicals.

<Sediment>

Chlorinated decanes: The presence of the substance in sediment was monitored at 60 sites, and it was detected at 30 of the 60 valid sites adopting the detection limit of 300pg/g-dry, and the detection range was up to 4,300pg/g-dry.

Chlorinated undecanes: The presence of the substance in sediment was monitored at 60 sites, and it was detected at 28 of the 60 valid sites adopting the detection limit of 400pg/g-dry, and the detection range was up to 7,000pg/g-dry.

Chlorinated dodecanes: The presence of the substance in sediment was monitored at 60 sites, and it was detected at 44 of the 60 valid sites adopting the detection limit of 400pg/g-dry, and the detection range was up to 12,000pg/g-dry.

Chlorinated tridecanes: The presence of the substance in sediment was monitored at 60 sites, and it was detected at 47 of the 60 valid sites adopting the detection limit of 400pg/g-dry, and the detection range was up to 31,000pg/g-dry.

<Wildlife>

Chlorinated decanes: The presence of the substance in bivalves was monitored in 3 areas, and it was detected at 2 of the 3 valid areas adopting the detection limit of 200pg/g-wet, and the detection range was up to tr(500)pg/g-wet.

For fish, the presence of the substance was monitored in 18 areas, and it was detected at 4 of the 18 valid areas adopting the detection limit of 200pg/g-wet, and the detection range was up to 700pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 200pg/g-wet, and the detection range was tr(300) ~ 600pg/g-wet.

Chlorinated undecanes: The presence of the substance in bivalves was monitored in 3 areas, and it was detected at 1 of the 3 valid areas adopting the detection limit of 300pg/g-wet, and the detected concentration was 800pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 4 of the 18 valid areas adopting the detection limit of 300pg/g-wet, and the detection range was up to 1,000pg/g-wet. For birds, the presence of the substance was monitored at both valid areas adopting the detection limit of 300pg/g-wet, and it was detected at both valid areas adopting the detection limit of 300pg/g-wet, and the detection range was up to 1,000pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 300pg/g-wet, and the detection range was tr(400) ~ 2,300pg/g-wet.

Chlorinated dodecanes: The presence of the substance in bivalves was monitored in 3 areas, and it was detected at 1 of the 3 valid areas adopting the detection limit of 200pg/g-wet, and the detected concentration was 400pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 3 of the 18 valid areas adopting the detection limit of 200pg/g-wet, and the detection range was up to tr(300)pg/g-wet. For birds, the presence of the substance was monitored at 1 of the 2 valid areas adopting the detection limit of 200pg/g-wet, and it was detected at 1 of the 2 valid areas adopting the detection limit of 200pg/g-wet, and it was detected at 1 of the 2 valid areas adopting the detection limit of 200pg/g-wet, and the detected concentration was 1,000pg/g-wet.

Chlorinated tridecanes: The presence of the substance in bivalves was monitored in 3 areas, and it was detected at 1 of the 3 valid areas adopting the detection limit of 200pg/g-wet, and the detected concentration was 900pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 2 of the 18 valid areas adopting the detection limit of 200pg/g-wet, and the detection range was up to 7,000pg/g-wet. For birds, the presence of the substance was monitored at both valid areas adopting the detection limit of 200pg/g-wet, and it was detected at both valid areas adopting the detection limit of 200pg/g-wet, and the detection range was $500 \sim 900pg/g$ -wet.

(Note) Chlorinated paraffins with 5~9 chlorines are target chemicals.

<Air>

Chlorinated decanes: The presence of the substance in air was monitored at 35 sites, and it was detected at all 35 valid sites adopting the detection limit of 100pg/m^3 , and the detection range was tr(100) ~ 900pg/m^3 .

Chlorinated undecanes: The presence of the substance in air was monitored at 35 sites, and it was detected at 34 of the 35 valid sites adopting the detection limit of 80pg/m³, and the detection range was up to 850pg/m³.

Chlorinated dodecanes: The presence of the substance in air was monitored at 35 sites, and it was detected at 27 of the 35 valid sites adopting the detection limit of 80pg/m³, and the detection range was up to 370pg/m³.

Chlorinated tridecanes: The presence of the substance in air was monitored at 35 sites, and it was detected at 26 of the 35 valid sites adopting the detection limit of 100pg/m³, and the detection range was up to tr(200)pg/m³.

Stocktaking of the detection of Chlorinated decanes, Chlorinated undecanes, Chlorinated dodecanes and Chlorinated
tridecanes in air during FY2016~2021

(Note) In FY2016, Chlorinated decanes with 4~6 chlorines and Chlorinated undecanes, Chlorinated dodecanes and Chlorinated tridecanes with 4~7 chlorines are target chemicals. From FY2017 to FY2019, Chlorinated paraffins with 4~7 chlorines are target chemicals. After FY2020, Chlorinated paraffins with 4~8 chlorines are target chemicals.

[24] Dicofol (references)

· History and state of monitoring

Dicofol was used as insecticides and mites etc., but the registration of Chlordanes under the Agricultural Chemicals Regulation Law was expired in FY2004. The substance was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2005. The substance was adopted as a target chemical at the COP9 of the Stockholm convention on Persistent Organic Pollutants held from late April to early May 2019.

Under the framework of the Initial Environmental Survey and the Detailed Environmental Survey etc., the substance was surveied in sediment in FY2004.

Under the framework of the Environmental Monitoring, the substance has been monitored in wildlife (bivalves, fish and birds) in FY2006, in surface water, sediment and wildlife (bivalves, fish and birds) in FY2008, in air in FY2016, in wildlife (bivalves, fish and birds) in FY2018, and in surface water, sediment, wildlife (bivalves, fish and birds) and air in FY2019 and FY2020.

No monitoring was conducted in FY2021. For reference, the monitoring results up to FY2020 are given below.

Monitoring results until FY2020

<Surface Water>

Stocktaking of the detection of Dicofol in surface water during FY2008~2020

	Monitored	Geometric				Quantification	Detection	Frequency
Dicofol	year	mean	Median	Maximum	Minimum	[Detection] limit	Sample	Site

[25] Perfluorohexane sulfonic acid (PFHxS)

· History and state of monitoring

Perfluorohexane sulfonic acid (PFHxS) is used as Fluoropolymer processing aid and Surfactant etc. Perfluorohexane sulfonic acid (PFHxS), its salts and PFHxS-related compounds were adopted as target chemicals at the COP10 of the Stockholm convention on Persistent Organic Pollutants in June 2022.

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water, and sediment in FY2018 and FY2019, in surface water, sediment, wildlife (bivalves, fish and birds) and air in FY2020 and FY2021.

· Monitoring results

<Surface Water>

The presence of the substance in surface water was monitored at 47 sites, and it was detected at 44 of the 47 valid sites adopting the detection limit of 30pg/L, and the detection range was up to 2,300pg/L.

Stocktaking of the detection of Perfluorohexane sulfonic acid (PFHxS) in surface water during FY2018~2021

Perfluorohexane	Monitored year	Geometric mean	Median	Maximum	Minimum	Quantification	Detection Frequency	
sulfonic acid (PFHxS)						[Detection] Limit	Sample	Site
	2018	190	130	2,600	nd	120 [50]	44/47	44/47
Surface water	2019	150	120	1,800	nd	60 [30]	45/48	45/48

	2021	nd	nd	15	nd	6 [3]	19/60	19/60

Stocktaking of the detection of Perfluorohexane sulfonic acid (PFHxS) in sediment during FY2018~2021

<Wildlife>

The presence of the substance in bivalves was monitored in 3 areas, and it was detected at 1 of the 3 valid areas adopting the detection limit of 2pg/g-wet, and the detected concentration was tr(3)pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 7 of the 18 valid areas adopting the detection limit of 2pg/g-wet, and the detection range was up to 16pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 2pg/g-wet, and the detection range was $10 \sim 40pg/g$ -wet.

Perfluorohexane	Monitored year	Geometric mean	Median	Maximum	Minimum	Quantification	Detection Frequency	
sulfonic acid (PFHxS)						[Detection] Limit	Sample	Site
Bivalves	2020	tr(2)	tr(3)	tr(3)	nd	5 [2]	2/3	2/3

Reference: Egg of Great Cormorants (egg yolk and white)

In the FY2021 monitoring survey, eggs of great cormorants were analyzed to check for the presence of 11 chemicals (groups): PCBs, Hexachlorobenzene, DDTs, Perfluorooctane sulfonic acid (PFOS), Perfluorooctanoic acids (PFOA), Pentachlorobenzene, Endosulfans, Polychlorinated Naphthalenes, Hexachlorobuta-1,3-diene, Short-chain chlorinated paraffins and Perfluorohexane sulfonic acid (PFHxS).

The eggs were taken around Koyaike pond*. The results of the analysis in Table 1.

(Note 1) *: The eggs were taken by Water and Air Quality Control Division, Environmental Management Bureau, Agricultural and Environmental Affairs Department, Hyogo Prefectural Government and Green Nature Division, Environmental Policy Office, Department of Citizen Autonomy, Itami City.

[17]	Pentachlorobenzene	3 [1]	22	5,600	390					
	Endosulfans									
[18]	[18-1] α-Endosulfan	3 [1]	nd	1,100	83					
	[18-2] β-Endosulfan	6 [2]	nd	740	34					
[20]	Total Polychlorinated Naphthalenes ^{*1}	30 [10]	nd	30	nd					
[21]	Hexachlorobuta-1,3-diene	13 [5]	nd	29	nd					
	Short-chain chlorinated paraffinsare									
	[23-1] Chlorinated decanes	900 [300]	nd	nd	nd					
[23]	[23-2] Chlorinated undecanes	800 [300]	nd	nd	1,100					
	[23-3] Chlorinated dodecanes	600 [200]	nd	900	nd					
	[23-4] Chlorinated tridecanes	500 [200]	nd	1,000	tr(300)					
[25]	Perfluorohexane sulfonic acid (PFHxS)	5 [2]	9	1,400	190					

Table 1 List of the detection values of egg of Great Cormorant

(Note 1) *1: The Quantification [Detection] limits were the sum of the Quantification [Detection] limits of each congener.

(Note 2) *2: These values are previously mentioned in the main part but are mentioned here again to indicate the stage of life cycle of great cormorants from egg to adult.
