Chapter 3 Results of the Environmental Monitoring in FY2022

1. Purpose of the monitoring

Environmental Monitoring provides annual surveys of the environmental persistence of target chemicals as listed in the Stockholm Convention, chemicals that while undesignated are still subject to review for potential risk, and/or highly persistent chemicals annotated as Specified Chemical Substances and Monitored Chemical Substances under the Law Concerning the Examination and Regulation of Manufacture, etc. of Chemical Substances (aka, the Chemical Substances Control Law), all target chemicals whose year to year changes in persistence in the environment must be understood.

*POPs: persistent organic pollutants

2. Target chemicals

In the FY2022 Environmental Monitoring, 11 chemicals (groups) were designated as target chemical.

2 of the target chemicals (groups) were Polychlorinated biphenyls (PCBs) and Hexachlorobenzene, which were listed as Persistent Organic Pollutants (POPs) initially in the Stockholm Convention in 2004[1]. 4 of them were HCHs (Hexachlorohexanes)[2], Polybromodiphenyl ethers (Br_4~Br_{10})[3], Perfluorooctane sulfonic acid (PFOS)[4] and Pentachlorobenzene, which were adopted to be the POPs at fourth meeting of the Conference of the Parties (COP) held 2009. 1 of them was 1,2,5,6,9,10-Hexabromocyclododecanes[5] which was adopted to be the POPs at sixth meeting of COP held 2013. 1 of them was Hexachlorobuta-1,3-diene, which were adopted to be the POPs at seventh meeting of COP held 2015. 1 of them was Short-chain chlorinated paraffins[6], which was adopted to be the POPs at eighth meeting of COP held 2017. 1 was Perfluorooctanoic acid (PFOA)[7], which was adopted to be the POPs at ninth meeting of COP held 2019. Another was Perfluorohexane sulfonic acid (PFHxS)[8], which was adopted to be the POPs at tenth meeting of COP held 2021 and 2022.

The combinations of target chemicals and the monitoring media are given below.

(Note 1) Up to FY2009, the 11 target chemicals (groups) were monitored each fiscal year. 10 out of the 11 target chemicals (groups) were exceptions of Polychlorinated dibenzo-p-dioxin (PCDDs) and Polychlorinated dibenzofurans (PCDFs) from 12 chemicals (groups) listed as the POPs initially in the Stockholm Convention. Another was HCHs (Hexachlorohexanes). As of FY2010, chemicals (groups) adopted or considerd to be the POPs in the convention have been monitored too, and adjustments made to implementation frequency. In FY2022, 11 chemicals (groups) that have been designated as target chemicals (groups) in this Environmental Monitoring were not moniterd. They were Aldrin, Dieldrin, Endrin, DDTs[9], Chlordanes[10], Heptachlors[11], Toxaphenes[12], Mirex, Chlordecone, Hexabromobiphenyls, Endosulfans, Polychlorinated Naphthalenes[13] Pentachlorophenol and its salts and esters[14] and Dicofol. Up to the latest results of the 14 chemicals (groups) have been included in this report for purpose of reference.

(Note 2) In the COP4, α-HCH, β-HCH and γ-HCH (synonym: Lindane) were adopted to be POPs among HCHs, but in this Environmental Monitoring, HCHs which were able to include δ-HCH were designated as target chemicals.

(Note 3) Tetrabromodiphenyl ethers, Pentabromodiphenyl ethers, Hexabromodiphenyl ethers, and Heptabromodiphenyl ethers were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants. Decabromodiphenyl ether was adopted as target chemicals at the COP8 of the Stockholm convention on Persistent Organic Pollutants.In the survey, Polybromodiphenyl ethers including those from 4 to 10 bromines are target chemicals.

(Note 4) Perfluorooctane sulfonic acid (PFOS), its salts and Perfluorooctane sulfonyl fluoride were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants. The survey of the Perfluorooctane sulfonic acid (PFOS) only monitored linear octyl Perfluorooctane sulfonic acid (PFOS).

(Note 5) *α*-1,2,5,6,9,10-Hexabromocyclododecane, *β*-1,2,5,6,9,10-Hexabromocyclododecane and *γ*-1,2,5,6,9,10-Hexabromocyclododecane were adopted as target chemicals at the COP6 of the Stockholm convention on Persistent Organic Pollutants. In the survey, 1,2,5,6,9,10-Hexabromocyclododecanes including *δ*-1,2,5,6,9,10-Hexabromocyclododecane and *ε*-1,2,5,6,9,10- Hexabromocyclododecane are target chemicals.

(Note 6) Chlorinated paraffins (C_{10}~C_{13}) was adopted as target chemicals at the COP8 of the Stockholm convention on Persistent Organic Pollutants. In the survey, Chlorinated paraffins with 5~9 chlorines are target chemicals in surface water, sediment and wildlife, and Chlorinated paraffins with 4~7 chlorines are target chemicals in air.

(Note 7) Perfluorooctanoic acid (PFOA), its salts and PFOA-related compounds were adopted as target chemicals at the COP9 of the Stockholm convention on Persistent Organic Pollutants. The survey of the Perfluorooctanoic acid (PFOA) only monitored linear octyl Perfluorooctanoic acid (PFOA).

(Note 8) Perfluorohexane sulfonic acid (PFHxS), its salts and PFHxS-related compounds were adopted as target chemicals at the COP9 of the Stockholm convention on Persistent Organic Pollutants. The survey of the Perfluorohexane sulfonic acid (PFHxS) only monitored linear hexyl Perfluorohexane sulfonic acid (PFHxS).

(Note 9) *p,p'*-DDT and *o,p'*-DDT were adopted as target chemicals of the Stockholm convention on Persistent Organic Pollutants. In the survey, DDTs including environmental degraded products *p,p'*-DDT, *o,p'*-DDT, *p,p'*-DDD and *o,p'*-DDD were target chemicals.

(Note 10) *cis*-Chlordane and *trans*-Chlordane were adopted as target chemical of the Stockholm convention on Persistent Organic Pollutants. In the survey, Chlordanes including *cis*-Chlordane, *trans*-Chlordane Oxychlordane, *cis*-Nonachlor and *trans*-Nonachlor are target chemicals.

(Note 11) Heptachlor was adopted as target chemical of the Stockholm convention on Persistent Organic Pollutants. In the survey, Heptachlors including *cis*-Heptachlor epoxide and *trans*-Heptachlor epoxide are target chemicals.

(Note 12) Chlorobornane and Chlorocamphene of industrial blended material (about 16,000 congeners or isomer) were adopted as target chemicals of the Stockholm convention on Persistent Organic Pollutants. In the survey, 2-endo,3-exo,5-endo,6-exo,8,8,10,10-octachlorobornane (Parlar-26), 2-endo,3-exo,5-endo,6-exo,8,8,9,10,10-nonachlorobornane (Parlar-50) and 2,2,5,5,8,9,9,10,10-Nonachlorobornane (Parlar-62) are target chemicals.

(Note 13) PCNs (Cl_2~Cl_8) was adopted as target chemicals at the COP7 of the Stockholm convention on Persistent Organic Pollutants. In the survey, PCNs including those with one (1) chlorine are target chemicals.

(Note 14) Pentachlorophenol and its salts and esters were adopted as target chemicals at the COP7 of the Stockholm convention on Persistent Organic Pollutants, the survey monitored Pentachlorophenol and Pentachloroanisole.

No	Name	Monitored media

(Note 1) *1: Organisations responsible for sampling are described by their official names in FY2022

(Note 2) *2: Because there were the examples of survey that obtained the eggs in other countries, the eggs of great cormorants were taken in this survey by Water and Air Division, Environment Department, Hyogo Prefectural Government and Green and Nature Section, Urban Transportation Department, Itami City. The results were treated as the reference values.

(Note 3) *3: That organization cooperated with a private analytical laboratory in sampling specimens

(2) Monitored sites (areas)

In the Environmental Monitoring (of surface water, sediment, wildlife, and air), the sampling of specimens was entrusted to prefectural governments and government-designated cities across Japan and the specimens sampled were analysed by private analytical laboratories.

The monitored sites (areas) are shown in Table 3-1-1 and Figure 3-1-1 for surface water, Table 3-1-2 and Figure 3-1-2 for sediment, Table 3-1-3 and Figure 3-1-3 for wildlife and Table 3-1-4 and Figure 3-1-4 for air. The breakdown is summarized as follows.

Monitored media	Numbers of local communities	Numbers of target chemicals (groups)	Numbers of monitored sites (or areas)	Numbers of samples at a monitored site (or area)
Surface water	43	11	48	1
Sediment	47	11	61	1*1
Wildlife (bivalves)	3	11	3	1*2
Wildlife (fish)	17	11	18	1*2
Wildlife (birds)	3*3	11	3*3	1*2
Air (warm season)	34*4	11	36	1 or 3*5
All media	58	11	123*3	

(Note 1) *1: For sediment, at each monitoring point, three (3) specimen samples were collected. The target substances were analysed for each place with one (1) specimen sample that is a mixture of equal parts of the three (3) specimen samples.

(Note 2) *2: For wildlife species, at each monitoring point, three (3) specimen samples were collected. The target substances were analysed for each place with one (1) specimen sample that is a mixture of equal parts of the three (3) specimen samples.

(Note 3) *3: Samples obtained in 1 site of the birds as wildlife eggs of Great Cormorant, and the sample was measured each the egg yolk and the egg white, the results were treated as a reference values.

(Note 4) *4: For 1 of the 34 organizations, it was cooperated with a private analytical laboratory in sampling specimens.

(Note 5) *5: The target substances other than [21] Hexachlorobuta-1,3-diene were analysed withe one (1) sample for each sit. The target substance [21] Hexachlorobuta-1,3-diene was analysed with the three (3) specimen samples for each site.

(3) Sampling method of specimens

The sampling of specimens and the preparation of samples were carried out following the “Guidelines on Conducting of Environmental Surveys and Monitoring of Chemicals” (published on March 2021) by the Environment Health and Safety Division, Environmental Health Department, Ministry of the Environment of Japan (MOE).

(4) Target species

The species to be monitored among the wildlife media were selected considering the possibility of international comparison, as well as their significance and practicality as indicators: 1 bivalve (blue mussel), 9 fishes (predominantly sea bass), and 1 bird (Great Cormorant), namely, 11 species in total.

The properties of the species determined as targets in the FY2022 monitoring are shown in Table 3-2. Moreover, Table 3-1-3 summarizes the outline of the samples used for analysis.

Table 3-1-1 List of monitored sites (surface water) in the Environmental Monitoring in FY2022

Local communities	Monitored sites	Sampling dates
Hokkaido	Ishikarikakokyo Bridge, Mouth of Riv. Ishikari (Ishikari City)	November 29, 2022

Oita Pref.	Mouth of Riv. Oita (Oita City)	November 18, 2022
Miyazaki Pref.	Mouth of Riv. Oyodo (Miyazaki City)	October 21, 2022
Kagoshima Pref.	Riv. Amori (Kirishima City)	November 10, 2022
	Riv. Gotanda (Ichikikushikino City)	October 31, 2022
Okinawa Pref.	Naha Port	November 9, 2022

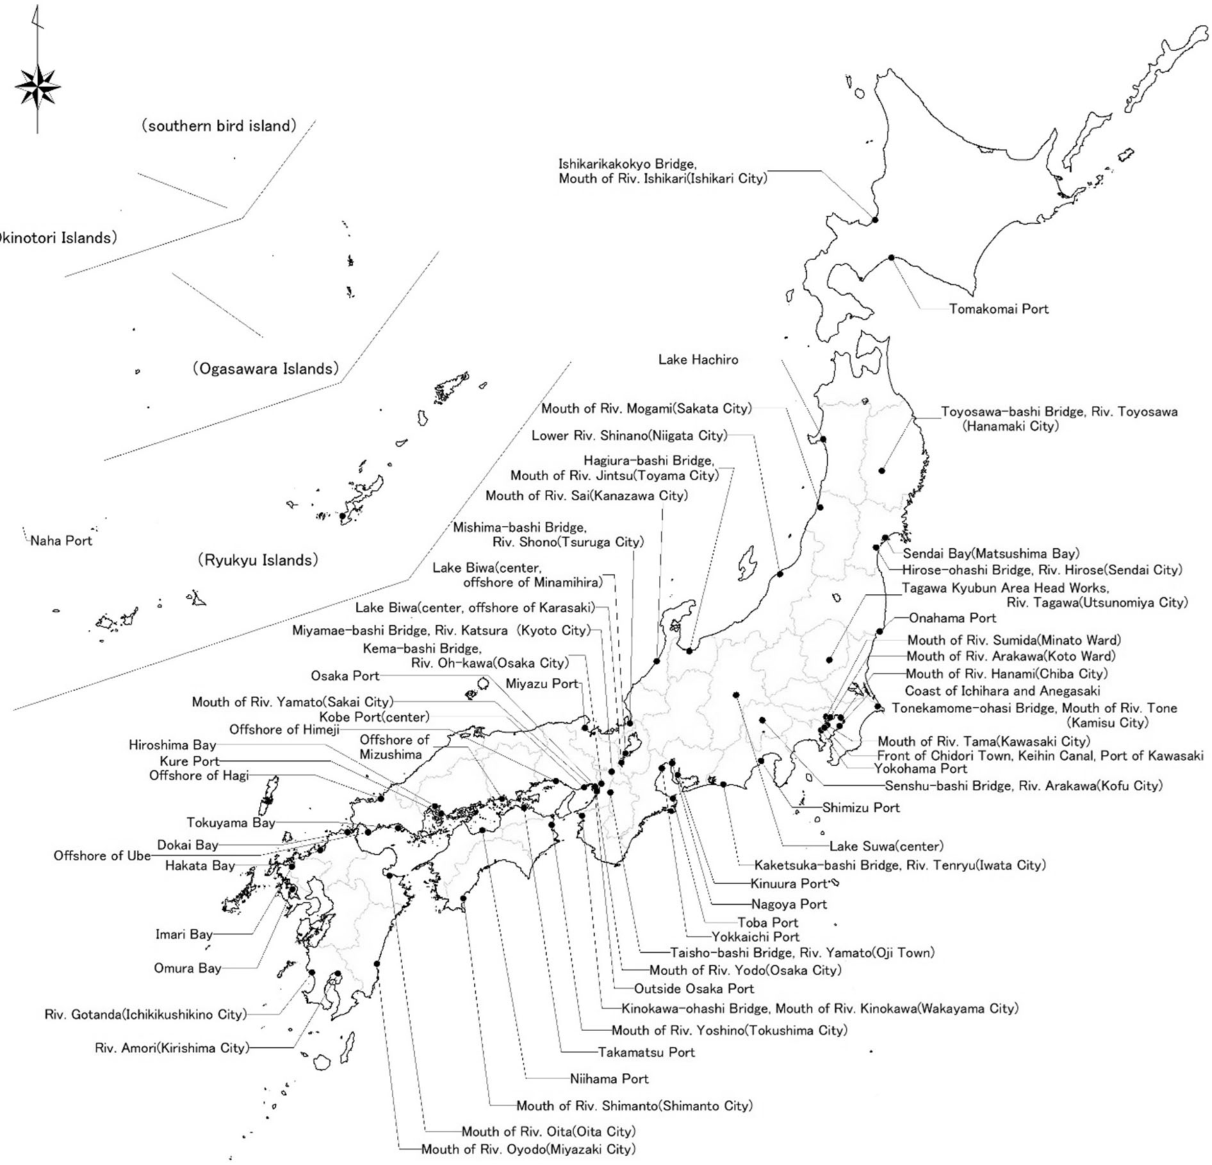

Figure 3-1-2 Monitored sites (sediment) in the Environmental Monitoring in FY2022

Table 3-1-3 List of monitored areas (wildlife) in the Environmental Monitoring in FY2022

Local communities	Monitored sites	Sampling dates	Wildlife species	
Hokkaido	Offshore of Kushiro	January 14, 2023	Fish	Rock greenling (*Hexagrammos lagocephalus*)
		October 31, 2022	Fish	Chum salmon (*Oncorhynchus keta*)
Iwate Pref.	Yamada Bay	October 24, 2022	Bibalves	Blue mussel (*Mytilus galloprovincialis*)
		October 15, 2022	Fish	Greenling (*Hexagrammos otakii*)
Miyagi Pref.	Sendai Bay (Matsushima Bay)	November 24, 2022	Fish	Greenling (*Hexagrammos otakii*)
Ibaraki Pref.	Offshore of Joban	January 18, 2023	Fish	Chub mackerel (*Scomber japonicus*)
Tokyo Met.	Tokyo Bay	October 4, 2022	Fish	Sea bass (*Lateolabrax japonicus*)
Yokohama City	Yokohama Port	September 26, 2022	Bibalves	Blue mussel (*Mytilus galloprovincialis*)
Kawasaki City	Offshore of Ogishima Island, Port of Kawasaki	September 26, 2022	Fish	Sea bass (*Lateolabrax japonicus*)
Ishikawa Pref.	Coast of Noto Peninsula	August 19, 2022	Bibalves	Blue mussel (*Mytilus galloprovincialis*)
Nagoya City	Nagoya Port	September 27, 2022	Fish	Striped mullet (*Mugil cephalus*)
Shiga Pref.	Tikubushima Island, Lake Biwa	July 29, 2022	Birds	Great Cormorant (*Phalacrocorax carbo*)
	Lake Biwa, Riv. Ado (Takashima City)	April 4, 2022	Fish	Dace (*Tribolodon hakonensis*)
Osaka Pref.	Osaka Bay	October 18, 2022	Fish	Sea bass (*Lateolabrax japonicus*)
Hyogo Pref.	Offshore of Himeji	December 18, 2022	Fish	Sea bass (*Lateolabrax japonicus*)
Tottori Pref.	Riv.Tenjin (Kurayoshi City)	March 24 and April 9, 2022	Birds	Great Cormorant (*Phalacrocorax carbo*)
	Nakaumi	October 25, 2022	Fish	Sea bass (*Lateolabrax japonicus*)
Hiroshima City	Hiroshima Bay	November 24 and 27, 2022	Fish	Sea bass (*Lateolabrax japonicus*)
Kagawa Pref.	Takamatsu Port	August 26, 2022	Fish	Striped mullet (*Mugil cephalus*)
Kochi Pref.	Mouth of Riv. Shimanto (Shimanto City)	September 1, 2, 9, 15, October 16 and November 15, 24, 28, 2022	Fish	Sea bass (*Lateolabrax japonicas*)
Oita Pref.	Mouth of Riv. Oita (Oita City)	January 25, 2023	Fish	Spanish mackerel (*Scomberomorus niphonius*)
Kagoshima Pref.	West Coast of Satsuma Peninsula	November 16, 2022	Fish	Sea bass (*Lateolabrax japonicas*)
Okinawa Pref.	Nakagusuku Bay	January 31, 2022	Fish	Okinawa seabeam (*Acanthopagrus sivicolus*)

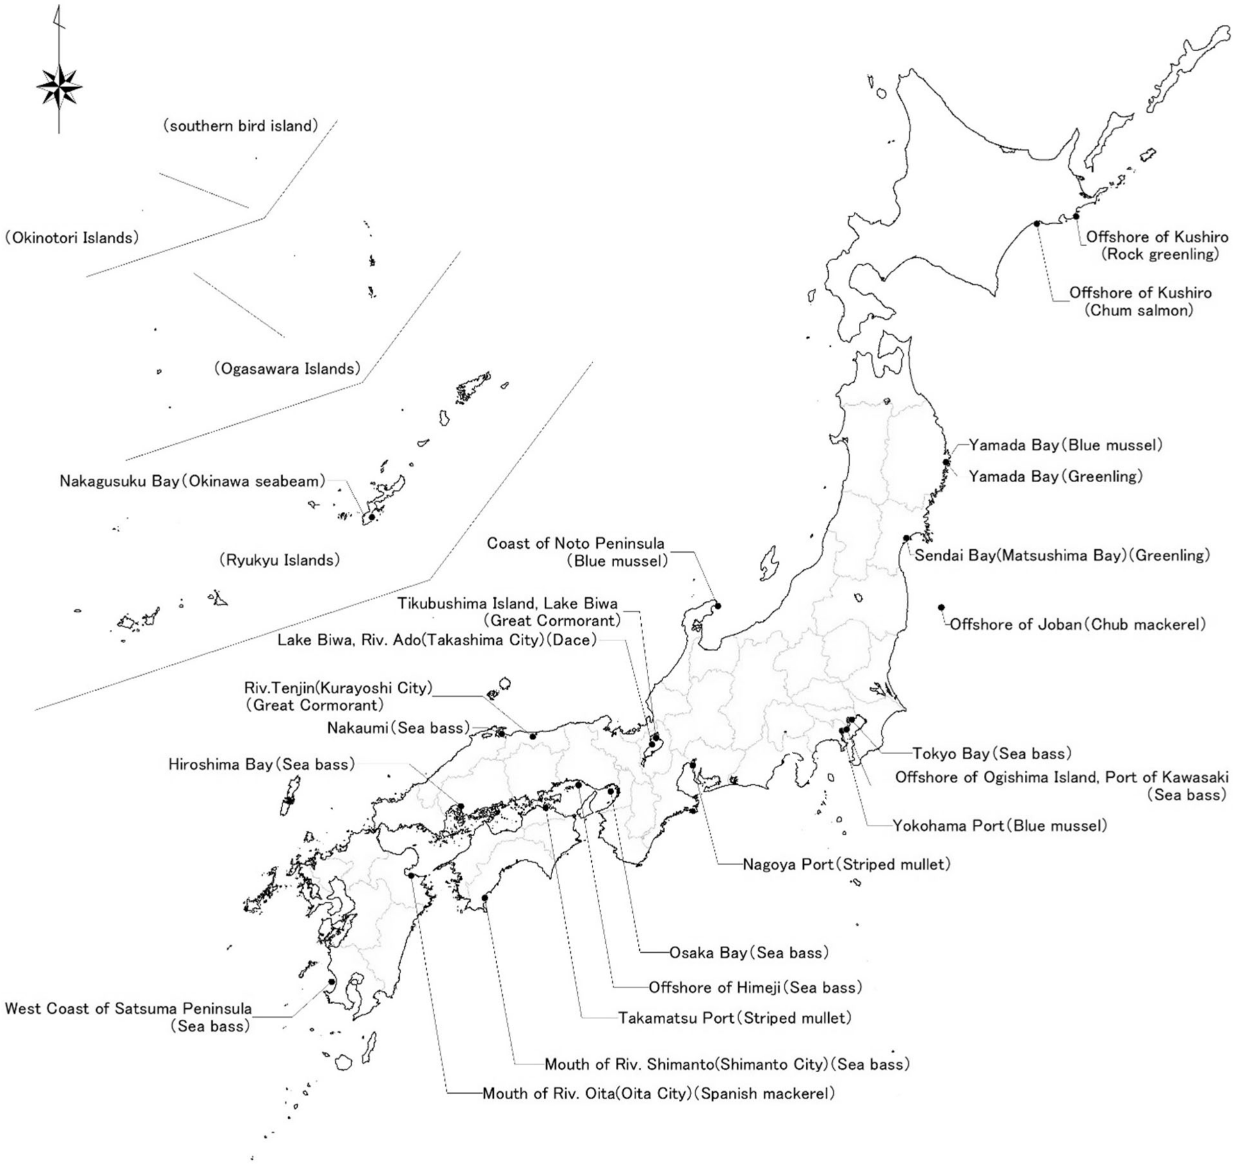

Figure 3-1-3 Monitored areas (wildlife) in the Environmental Monitoring in FY2022

Table 3-1-4 List of monitored sites (air) in the Environmental Monitoring in FY2022

Local communities	Monitored sites	Sampling dates (Warm season)
Hokkaido	Kamikawa General Subprefectural Bureau (Asahikawa City)	Octorber 4 ~ 11** or Octorber 4 ~ 7*, 2022
Sapporo City	Sapporo Art Park (Sapporo City)	Octorber 3 ~ 6, 2022
Iwate Pref.	Sugo Air Quality Monitoring Station (Takizawa City)	September 27 ~ 30, 2022
Miyagi Pref.	Miyagi Prefectural Institute of Public Health and Environment (Sendai City)	Octorber 24 ~ 31** or Octorber 24 ~ 27*, 2022
Yamagata Pref.	Yamagata Institute of Environmental Sciences (Murayama City)	September 26 ~ Octorber 3** or September 27 ~ 30*, 2022
Ibaraki Pref.	Ibaraki Kasumigaura Environmental Science Center (Tsuchiura City)	September 27 ~ Octorber 4** or September 27 ~ 30*, 2022
Tokyo Met.	Tokyo Metropolitan Research Institute for Environmental Protection (Koto Ward)	Octorber 17 ~ 24** or Octorber 17 ~ 20*, 2022
	Chichijima Island (Ogasawara Village)	November 8 ~ 15** or November 8 ~ 11*, 2022
Kanagawa Pref.	Kanagawa Environmental Research Center (Hiratsuka City)	November 8 ~ 11, 2022
Yokohama City	Yokohama Environmental Science Research Institute (Yokohama City)	Octorber 11 ~ 18** or Octorber 11 ~ 14*, 2022
Niigata Pref.	Oyama Air Quality Monitoring Station (Niigata City)	September 26 ~ 29, 2022
Toyama Pref.	Tonami Air Quality Monitoring Station (Tonami City)	September 12 ~ 15, 2022
Ishikawa Pref.	Ishikawa Prefectural Institute of Public Health and Environmental Science (Kanazawa City)	September 12 ~ 15, 2022
Yamanashi Pref.	Yamanashi Prefectural Institute of Public Health and Environment (Kofu City)	September 26 ~ 29, 2022
Nagano Pref.	Nagano Environmental Conservation Research Institute (Nagano City)	November 7 ~ 14** or November 7 ~ 10*, 2022
Gifu Pref.	Gifu Prefectural Research Institute for Health and Environmental Sciences (Kakamigahara City)	Octorber 24 ~ 27, 2022
Nagoya City	Chikusa Ward Heiwa Park (Nagoya City)	Octorber 4 ~ 11** or Octorber 4 ~ 7*, 2022
Mie Pref.	Mie Prefecture Health and Environment Research Institute (Yokkaichi City)	Octorber 24 ~ 27, 2022
Kyoto Prif.	Kyoto Prefecture Joyo Senior High School (Joyo City)	September 26 ~ 29, 2022
Osaka Pref.	Osaka Joint Prefectural Government Building, Building 2 Annex (Osaka City)	Octorber 11 ~ 14, 2022
Hyogo Pref.	Hyogo Prefectural Environmental Research Center (Kobe City)	September 26 ~ 29, 2022
Kobe City	Kobe City Institute of Health and Environmental Sciences (Kobe City)	Octorber 3 ~ 6, 2022
Nara Pref.	Tenri Air Quality Monitoring Station (Tenri City)	Octorber 24 ~ 27, 2022
Shimane Pref.	Oki National Acid Rain Observatory (Okinoshima Town)	Octorber 24 ~ 27, 2022
Hiroshima City	Hiroshima City Kokutaiji Junior High School (Hiroshima City)	Octorber 17 ~ 20, 2022
Yamaguchi Pref.	Yamaguchi Prefectural Institute of Public Health and Environment (Yamaguchi City)	September 13 ~ 20** or September 13 ~ 16*, 2022
	Hagi Health and Welfare Center (Hagi City)	September 13 ~ 20** or September 13 ~ 16*, 2022
Tokushima Pref.	Tokushima Prefectural Public Health, Pharmaceutical and Environmental Sciences Center (Tokushima City)	Octorber 24 ~ 27, 2022
Kagawa Pref.	Kagawa Prefectural Research Institute for Environmental Sciences and Public Health (Takamatsu City)	September 27 ~ Octorber 4** or September 27 ~ 30*, 2022
Ehime Pref.	Ehime Prefectural Government Nanyo Regional Office (Uwajima City)	November 7 ~ 10, 2022
Fukuoka Pref.	Omuta City Government Building (Omuta City)	Octorber 4 ~ 7, 2022
Saga Pref.	Saga Prefectural Environmental Research Center (Saga City)	September 27 ~ Octorber 4** or September 27 ~ 30*, 2022
Kumamoto Pref.	Kumamoto Prefectural Institute of Public Health and Environmental Science (Udo City)	November 7 ~ 10, 2022
Miyazaki Pref.	Miyazaki Prefectural Institute for Public Healthand Environment (Miyazaki City)	Octorber 11 ~ 18** or Octorber 11 ~ 14*, 2022
Kagoshima Pref.	Kagoshima Prefectural Institute for Environmental Research and Public Health (Kagoshima City)	September 26 ~ 29, 2022
Okinawa Pref.	Cape Hedo (Kunigami Village)	September 26 ~ 29, 2022

(Note) " * " means sampling except [21] Hexachlorobuta-1,3-diene. " ** " means sampling [21] Hexachlorobuta-1,3-diene.

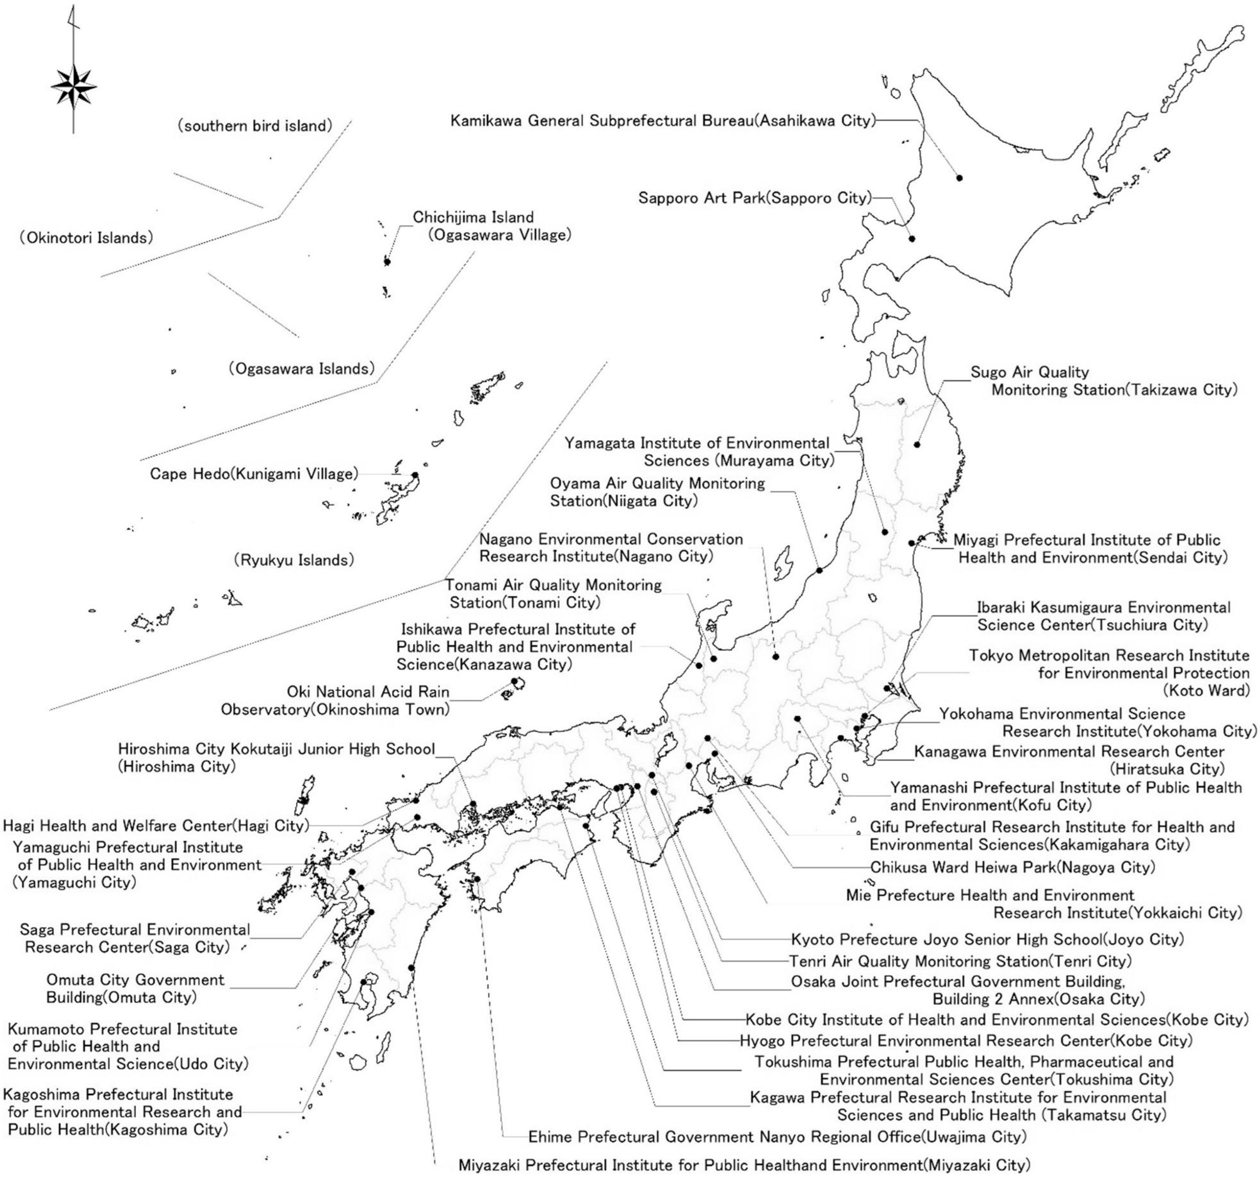

Figure 3-1-4 Monitored sites (air) in the Environmental Monitoring in FY2022

Table 3-2 Properties of target species

Species		Properties	Monitored areas	Aim of monitoring	Notes
Bibalves	Blue mussel (*Mytilus galloprovincialis*)	Distributed worldwide, excluding tropical zones Adheres to rocks in inner bays and to bridge piers	・Yamada bay ・Yokohama port ・Coast of Noto Peninsula	Follow-up of the environmental fate and persistency in specific areas	Monitored in the 3 areas with different levels of persistency
Fish	Greenling (*Hexagrammos otakki*)	Distributed from Hokkaido to southern Japan, the Korean Peninsula, and China Lives in shallow seas of 5-50 m depth from sea level	・Yamada bay ・Sendai Bay	Follow-up of the environmental fate and persistency in specific areas	
	Chum salmon (*Oncorhynchus keta*)	Distributed in northern Pacific Ocean, Sea of Japan, Bering Sea, Sea of Okhotsk, the whole of the Gulf of Alaska, and part of the Arctic Ocean Runs the Tone River on the Pacific Ocean side and rivers in Yamaguchi Prefecture and northward on the Sea of Japan side in Japan Bioaccumulation of chemicals is said to be moderate	・Offshore of Kushiro	Follow-up of the environmental fate and persistency on a global scale	
	Dace (*Tribolodon hakonensis*)	Distributed widely in freshwater environments throughout Japan Preys mainly on insects	・Lake Biwa, Riv. Ado (Takashima City)	Follow-up of the environmental fate and persistency in specific areas	
	Spanish mackerel (*Scomberomorus niphonius*)	Distributed in subtropical and temperate zones of East Asia Lives in coastal surface layer from spring to autumn and in deeper water in winter	・Mouth of Riv. Oita (Oita City)	Follow-up of the environmental fate and persistency in specific areas	
	Rock greenling (*Hexagrammos lagocephalus*)	Lives in cold-current areas of Hidaka and eastward (Hokkaido) Larger than the greenling and eats fish smaller than its mouth size at the sea bottom	・Offshore of Kushiro	Follow-up of the environmental fate and persistency in specific areas	
	Sea bass (*Lateolabrax japonicus*)	Distributed around the shores of various areas in Japan, the Korean Peninsula, and the coastal areas of China Sometimes lives in a freshwater environment and brackish-water regions during its life cycle Bioaccumulation of chemicals is said to be high	・Tokyo Bay ・Offshore of Ogishima Island, Port of Kawasaki ・Osaka Bay ・Offshore of Himeji ・Nakaumi ・Hiroshima Bay ・Mouth of Riv. Shimanto ・West Coast of Satsuma Peninsula	Follow-up of the environmental fate and persistency in specific areas	Monitored in the 8 areas with different levels of persistency
	Striped mullet (M*ugil cephalus*)	Distributed widely in the worldwide tropical zones and subtropical zones Sometimes lives in a freshwater environment and brackish-water regions during its life cycle	・Nagoya Port ・Offshore of Joban	Follow-up of the environmental fate and persistency in specific areas	
	Chub mackerel (*Scomber japonicus*)	Ddistributed widely in subtropical zones and temperate zones around the world. Seasonal migration occurs with a northward migration in spring and a southward migration in autumn.	・Offshore of Joban	Follow-up of the environmental fate and persistency in specific areas	
	Okinawa seabeam (*Acanthopagrus sivicolus*)	Distributed around Nansei Shoto (Ryukyu Islands) Lives in coral reefs and in bays into which rivers flow	・Nakagusuku Bay	Follow-up of the environmental fate and persistency in specific areas	
Birds	Great Cormorant (immature)* (*Phalacrocorax carbo*)	Distributed widely throughout Japan Eats primarily fish Bioaccumulation of chemicals is said to be high	・Tikubushima Island, Lake Biwa ・Riv.Tenjin (Kurayoshi City)	Follow-up of the concentrations of chemicals in top predators	

* Because there were the examples of survey that obtained the eggs in other countries, the eggs of great cormorants were taken at ather area in this survey. The results were treated as the reference values.

Table 3-3-1 Basic data of specimens (bivalves as wildlife) in the Environmental Monitoring in FY 2022

Bivalve species and Area	No.	Sampling month	Sex	Number of animals	Length (cm) (Average)	Weight (g) (Average)	Water content %	Lipid content %
Blue mussel	1	October,	Uncertain	100	8.9 ~ 11.0 (9.5)	48.6 ~ 123.2 (75.1)	78.9	1.7
(*Mytilus galloprovincialis*)	2	2022	Uncertain	173	7.9 ~ 8.5 (8.2)	32.2 ~ 64.2 (47.9)	77.6	2.0
Yamada Bay	3		Uncertain	279	6.9 ~ 7.5 (7.3)	26.6 ~ 42.1 (34.9)	78.5	2.0
Blue mussel	1	September,	Mixed	94	4.4 ~ 6.0 (5.0)	9.6 ~ 22.9 (15.5)	82.7	1.4
(*Mytilus galloprovincialis*)	2	2022	Mixed	96	3.5 ~ 6.5 (5.3)	5.2 ~ 23.8 (16.4)	82.4	1.5
Yokohama Port	3		Mixed	109	3.9 ~ 5.9 (4.9)	6.0 ~ 24.7 (13.7)	82.3	1.5
Blue mussel	1	August,	Uncertain	31	13.8 ~ 17.5 (15.6)	186.3 ~ 347.2 (261.8)	79.9	1.4
(*Mytilus galloprovincialis*)	2	2022	Uncertain	47	11.5 ~ 14.2 (12.9)	119.6 ~ 286.6 (177.7)	78.1	1.4
Coast of Noto Peninsula	3		Uncertain	76	8.3 ~ 11.0 (9.6)	51.4 ~ 120.2 (79.0)	76.6	1.7

Table 3-3-2 Basic data of specimens (fish as wildlife) in the Environmental Monitoring in FY 2022

Fish species and Area	No.	Sampling month	Sex	Number of animals	Length (cm) (Average)	Weight (g) (Average)	Water content %	Lipid content %
Rock greenling (*Hexagrammos*	1	January,	Mixed	1	45.0	1,500	78.9	2.9
lagocephalus)	2	2023	Mixed	1	47.3	1,510		
Offshore of Kushiro	3		Mixed	1	47.5	1,600		
Chum salmon	1	October,	Mixed	2	57.0 ~ 60.0 (58.0)	1,695 ~ 1,765 (1,730)	74.0	2.0
(*Oncorhynchus keta*)	2	2022	Female	1	62.0	2,150	76.0	1.3
Offshore of Kushiro	3		Male	1	66.5	2,152	72.0	2.3
Greenling	1	October,	Uncertain	8	31.9 ~ 38.0 (34.2)	917 ~ 1,265 (1,096)	71.5	6.0
(*Hexagrammos otakii*)	2	2022	Uncertain	10	29.8 ~ 32.5 (31.0)	584 ~ 824 (662)	73.3	4.4
Yamada Bay	3		Uncertain	10	24.8 ~ 29.0 (26.6)	313 ~ 524 (397)	73.5	3.7
Greenling	1	December,	Uncertain	13	18.4 ~ 32.8 (25.2)	120 ~ 700 (349)	77.2	1.2
(*Hexagrammos otakii*)	2	2022	Uncertain	10	22.6 ~ 31.0 (25.2)	240 ~ 600 (364)		
Sendai Bay (Matsushima Bay)	3		Uncertain	5	24.2 ~ 37.9 (29.4)	280 ~ 1,300 (612)		
Chub mackerel	1	January,	Uncertain	26	23.0 ~ 23.5 (24.3)	147 ~ 206 (165)	31.4	11.7
(*Scomber japonicus*)	2	2023	Uncertain	19	25.0 ~ 27.5 (26.1)	212 ~ 313 (250)	30.9	4.2
Offshore of Joban	3		Uncertain	11	31.0 ~ 35.5 (32.7)	446 ~ 601 (515)	29.5	3.3
Sea bass	1	October,	Mixed	4	47.3 ~ 52.0 (48.9)	1,540 ~ 1,970 (1,740)	77.1	1.1
(*Lateolabrax japonicus*)	2	2022	Mixed	5	45.5 ~ 47.5 (46.2)	1,330 ~ 1,440 (1,378)	77.1	1.8
Tokyo Bay	3		Mixed	5	37.0 ~ 43.7 (41.6)	820 ~ 1,170 (1,030)	77.4	1.9
Sea bass	1	September,	Male	15	28.6 ~ 33.4 (30.9)	366 ~ 538 (456)	82.4	2.3
(*Lateolabrax japonicus*)	2	2022	Female	16	26.4 ~ 31.4 (30.0)	272 ~ 525 (423)	70.6	1.5
Offshore of Ogishima Island, Port of Kawasaki	3		Male	15	31.4 ~ 33.7 (32.3)	429 ~ 532 (488)	76.9	2.0
Striped mullet	1	September,	Uncertain	5	47.0 ~ 50.1 (48.4)	1,109 ~ 1,419 (1,287)	75.1	3.3
(*Mugil cephalus*)	2	2022	Uncertain	5	46.0 ~ 48.0 (47.2)	1,029 ~ 1,112 (1,065)		
Nagoya Port	3		Uncertain	5	44.0 ~ 46.0 (45.2)	906 ~ 1,143 (991)		
Dace	1	April,	Female	28	23.3 ~ 30.5 (26.9)	170 ~ 477 (260)	76.7	2.9
(*Tribolodon hakonensis*) Lake Biwa, Riv. Ado	2	2022	Male	30	23.5 ~ 29.0 (25.6)	158 ~ 328 (216)	76.7	2.7
(Takashima City)	3		Female	29	23.2 ~ 31.5 (26.4)	164 ~ 398 (251)	76.8	3.1

Table 3-3-3 Basic data of specimens (birds as wildlife) in the Environmental Monitoring in FY 2022

Bird species (Area)	No.	Sampling month	Sex	Number of animals	Length (cm)	Weight (g)	Water content %	Lipid content %
Great Cormorant (*Phalacrocorax carbo*) Lake Biwa(Lake Kita, offshore of Tikubushima Island)	1	August, 2022	Female	3	119.0 ～ 122.4 (120.6)	1,692 ～ 1,760 (1,732)	69.9	3.6
	2		Male	3	123.0 ～ 130.0 (125.8)	2,160 ～ 2,300 (2,213)		
	3		Male	4	124.5 ～ 130.5 (128.3)	1,840 ～ 2,040 (1,928)		
Great Cormorant (*Phalacrocorax carbo*) Riv.Tenjin (Kurayoshi City)	1	March and April, 2021	Female	1	122.0	1,650	75.8	3.3
	2		Female	1	123.7	1,590		

(Note 1) The great cormorants (immature) killed as harmful birds were used as specimens.

(Note 2) For Great Cormorant, at Riv.Tenjin (Kurayoshi City), two (2) specimen samples were collected. The target substances were analysed for each place with one (1) specimen sample that is a mixture of equal parts of the two (2) specimen samples.

4. Method for regression analysis and testing

The analysis procedure and the evaluation for the analysis result shown in Fig.2 were carried out by the following method.

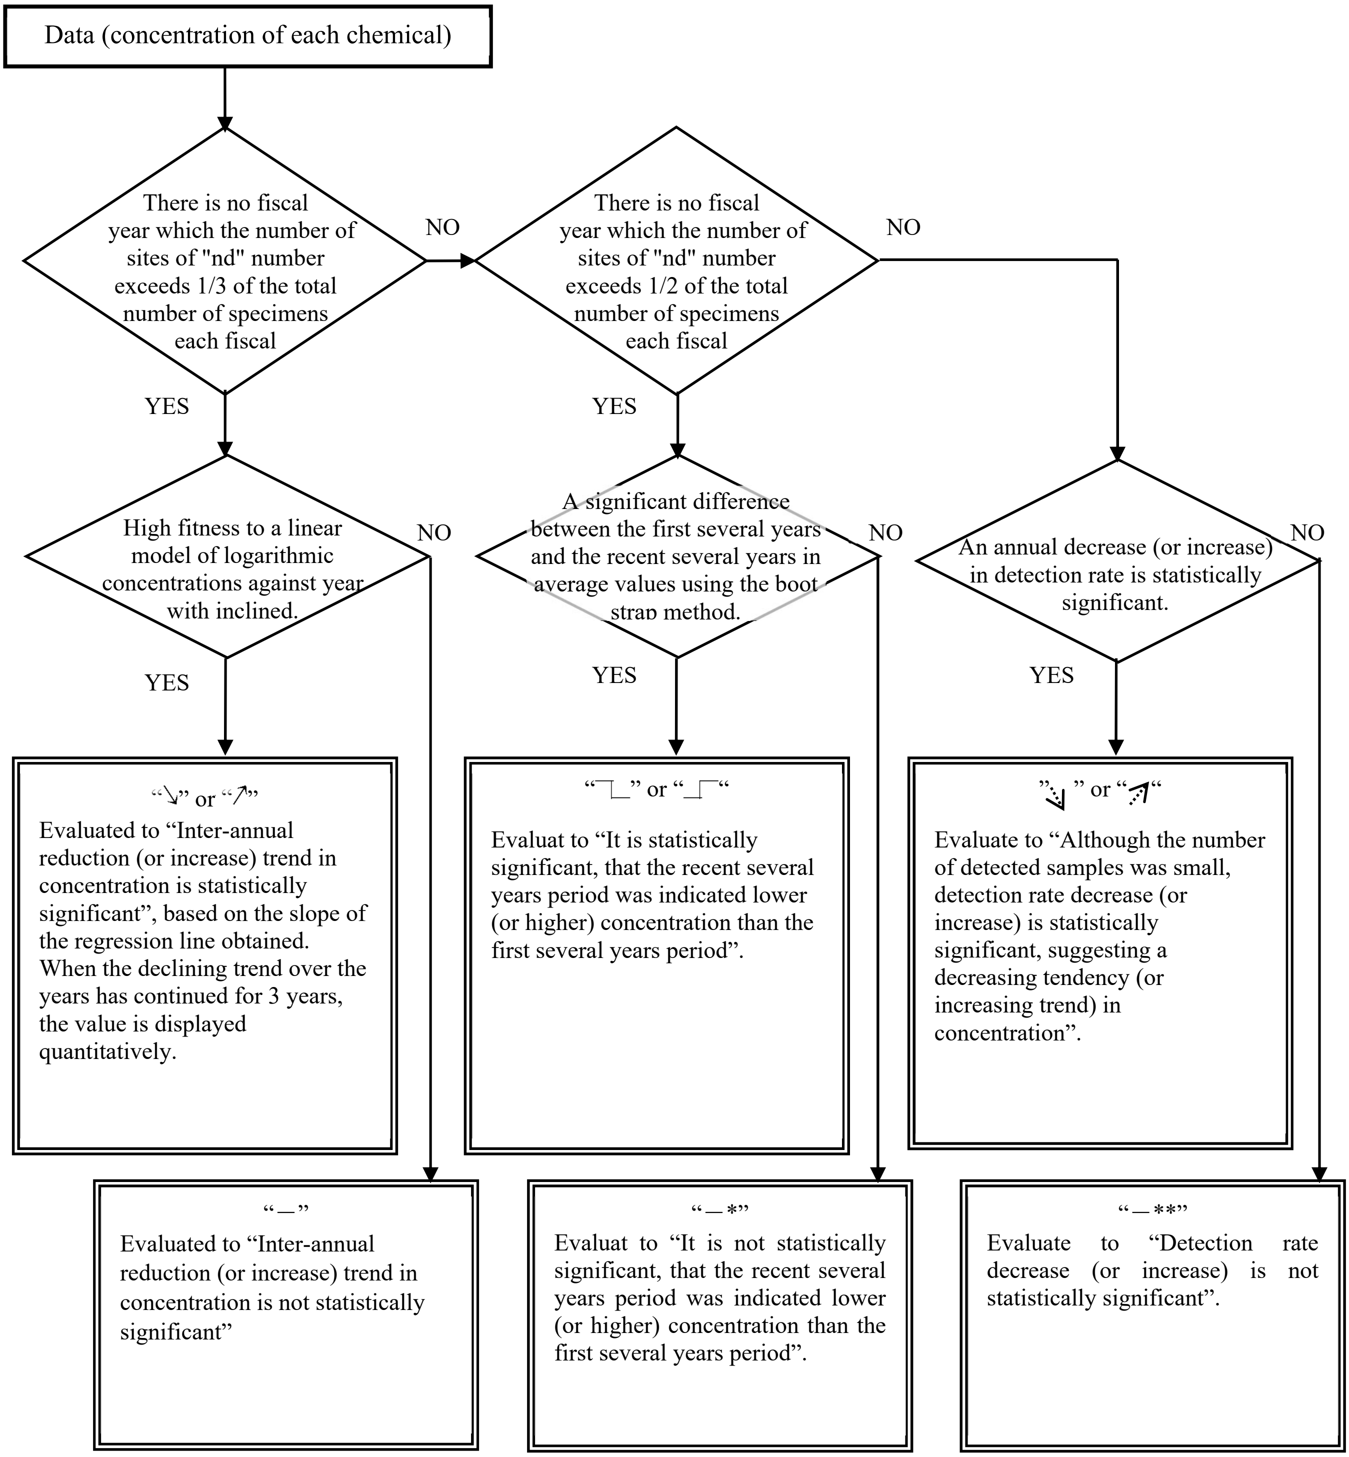

Figure 2 Method for regression analysis and testing

5. Summary of monitoring results

The detection ranges are shown in Table 3-4, and the detection limits are shown in Table 3-5.

The substances which were moniterd FY2022 and past years on the same media, were statistically analysed in order to detect inter-annual trends of increase or decrease. The results of the analyses are shown in Table 3-6

○Data were carefully handled on the basis of following points.

・For sediment

At each monitoring point, three (3) specimen samples were collected. And the substances were analysed for each place with one specimen sample that is a mixture of equal parts of the three (3) specimen samples.

・For wildlife

At each monitoring point, three (3) specimen samples were collected in principle. And the substances were analysed for each place with one specimen sample that is a mixture of equal parts of the three (3) specimen samples.

・For air

At each monitored site, the sampling was for the monitoring in the warm season (September 12, 2022 ~ November 15, 2022).

Table 3-4-1 List of the detection ranges in the Environmental Monitoring in FY2022 (Part 1)

No.	Target chemicals	Surface water (pg/L) Range (Frepuency)	Surface water (pg/L) Av.	Sediment (pg/g-dry) Range (Frepuency)	Sediment (pg/g-dry) Av.
[1]	Total PCBs	nd ~ 3,900 (46/48)	110	20 ~ 340,000 (61/61)	4,600

(Note 1) Each quantification limit is shown above the corresponding [detection limit].
(Note 2) “ * ” means the quantification [detection] limit is the sum value of congeners.
(Note 3) The same quantification [detection] limit was employed for bivalves, fish and birds as wildlife for each target chemical.
(Note 4) “　” means the medium was not monitored.

(Note) There are monitored sites which were classified in the area unlike these names by the situations.

In the wake of the monitoring surveys of FY2002~2022, high-sensitivity analysis of PCBs, and HCB were conducted. All these chemicals were detected.

High-sensitivity analysis of HCHs (Hexachlorohexanes), Polybromodiphenyl ethers (Br_4~Br_{10}), Perfluorooctane sulfonic acid (PFOS), Perfluorooctanoic acid (PFOA), Pentachlorobenzene, 1,2,5,6,9,10-Hexabromocyclododecanes, Hexachlorobuta-1,3-diene, Short-chain chlorinated paraffins and Perfluorohexane sulfonic acid (PFHxS) were also conducted in FY2022.

Except for cases of undetected Heptabromodiphenyl ethers in wildlife (bivalves), Nonabromodiphenyl ethers in wildlife (bivalves and fise), *α*-1,2,5,6,9,10-Hexabromocyclododecane in surface water, *β*-1,2,5,6,9,10-Hexabromocyclododecane in surface water and wildlife, *γ*-1,2,5,6,9,10-Hexabromocyclododecane in surface water and wildlife (birds), *δ*-1,2,5,6,9,10-Hexabromocyclododecane in surface water and wildlife, *ε*-1,2,5,6,9,10-Hexabromocyclododecane in surface water sediment and wildlife, Hexachlorobuta-1,3-diene in surface water and wildlife (bivalves and birs), Chlorinated undecanes in wildlife (birs) and Perfluorohexane sulfonic acid (PFHxS) in wildlife (bivalves), all chemicals were detected.

The monitoring results for each chemical (group) are described below.

[1] Total PCBs

・ History and state of monitoring

Polychlorinated biphenyls (PCBs) were used in industry as heat exchange fluids, etc. and were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in June 1974, since the substances are persistent, highly accumulative in living organisms, and chronically toxic. Also the substances are one of the original twelve POPs covered by the Stockholm Convention.

In previous monitoring series, the substances were monitored in wildlife (bivalves, fish and birds) during the period of FY1978~2001 under the framework of "the Wildlife Monitoring." Under the framework of "The Follow-up Survey of the Status of Pollution by Unintentionally Formed Chemicals," sediment and wildlife (fish) were the monitored media in FY1996 and FY1997, and surface water, sediment, wildlife (fish) and air were the monitored media in FY2000 and FY2001.

Under the framework of the Environmental Monitoring, the substances in surface water sediment wildlife (bivalves, fish and birds) and air have been monitored since FY2002.

・ Monitoring results

<Surface Water>

The presence of the substances in surface water was monitored at 48 sites, and it was detected at 46 of the 48 valid sites adopting the detection limit of 5pg/L, and the detection range was up to 3,900pg/L.

As results of the inter-annual trend analysis from FY2002 to FY2021, reduction tendencies in specimens from river areas, lake areas and river mouth areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

Stocktaking of the detection of Total PCBs (total amount) in surface water during FY2002~2022

Total PCBs (total amount)	Monitored year	Geometric mean*1	Median	Maximum	Minimum	Quantification [Detection] Limit*2	Detection Frequency	
							Sample	Site
Surface water (pg/L)	2002	470	330	11,000	60	7.4 [2.5]	114/114	38/38

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2002.

(Note 2) *2: The sum value of the Quantification [Detection] limits of each congener

<Sediment>

The presence of the substances in sediment was monitored at 61 sites, and it was detected at all 61 valid sites adopting the detection limit of 3pg/g-dry, and the detection range was 20 ~ 340,000pg/g-dry.

As results of the inter-annual trend analysis from FY2002 to FY2021, reduction tendencies in specimens from river areas, river mouth areas and sea areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in sediment was also identified as statistically significant.

Stocktaking of the detection of Total PCBs (total amount) in sediment during FY2002~2022

(Note 1) *1 : Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2002~2009.

(Note 2) 2: The sum value of the Quantification [Detection] limits of each congener

<Wildlife>

The presence of the substances in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 5pg/g-wet, and the detection range was 230 ~ 10,000pg/g-wet. For fish, the presence of the substances was monitored in 18 areas, and it was detected at all 18 valid areas adopting the detection limit of 5pg/g-wet, and the detection range was 600 ~ 150,000pg/g-wet. For birds, the presence of the substances was monitored in 2 areas, and it was detected at all 2 valid areas adopting the detection limit of 5pg/g-wet, and the detection range was 190,000 ~ 200,000pg/g-wet.

As results of the inter-annual trend analysis from FY2002 to FY2022, reduction tendencies in specimens from bivalves and fish were identified as statistically significant.

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2002~2009.
(Note 2) *2: The sum value of the Quantification [Detection] limits of each congener
(Note 3) *3: There is no consistency between the results of the ornithological survey after FY2013 and those in previous years because of the changes in the survey sites and target species.

<Air>

The presence of the substances in air was monitored at 36 sites, and it was detected at all 36 valid sites adopting the detection limit of 0.3pg/m^3, and the detection range was 18 ~ 190pg/m^3.

As a result of the inter-annual trend analysis from FY2003 to FY2022, a reduction tendency in specimens from warm season was identified as statistically significant.

	2022 Warm season	78	82	190	18	0.9 [0.3]	36/36	36/36

(Note 1) *1: The sum value of the Quantification [Detection] limits of each congener
(Note 2) *2: In 2002, there was a technical problem in the measuring method for lowly chlorinated congeners, and therefore the values are shown just as reference.

[2] Hexachlorobenzene

・ History and state of monitoring

Hexachlorobenzene was used as pesticidal material and was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in August 1979. Also the substance is one of the original twelve POPs covered by the Stockholm Convention.

In previous monitoring series, the substance was monitored in wildlife (bivalves, fish and birds) during the period of FY1978~1996 and in FY1998, FY2000 and FY2001 under the framework of "the Wildlife Monitoring." Under the framework of "the Surface Water/Sediment Monitoring," the substance in surface water and sediment was monitored during the period of FY1986~1998 and FY1986~2001, respectively.

Under the framework of the Environmental Monitoring, the substance in surface water sediment wildlife (bivalves, fish and birds) and air has been monitored since FY2002.

・ Monitoring results

<Surface Water>

The presence of the substance in surface water was monitored at 48 sites, and it was detected at all 48 valid sites adopting the detection limit of 0.3pg/L, and the detection range was 1.6 ~ 70pg/L.

As results of the inter-annual trend analysis from FY2002 to FY2022, reduction tendencies in specimens from river areas, lake areas and river mouth areas were identified as statistically significant.

The recent 7 years period was indicated lower concentration than the first 7 years period in specimens from sea areas as statistically significant. And a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

Stocktaking of the detection of Hexachlorobenzene in surface water during FY2002~2022

HCB	Monitored year	Geometric mean*	Median	Maximum	Minimum	Quantification [Detection] limit	Detection Frequency

(Note) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2002.

<Sediment>

The presence of the substance in sediment was monitored at 61 sites, and it was detected at all 61 valid sites adopting the detection limit of 0.3pg/g-dry, and the detection range was 1.6 ~ 4,800pg/g-dry.

As results of the inter-annual trend analysis from FY2002 to FY2022, reduction tendencies in specimens from river areas and sea areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in sediment was also identified as statistically significant.

(Note) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.

<Wildlife>

The presence of the substance in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 0.8pg/g-wet, and the detection range was 7.6 ~ 9.1pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at all 18 valid areas adopting the detection limit of 0.8pg/g-wet, and the detection range was 16 ~ 710pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at all 2 valid areas adopting the detection limit of 0.8pg/g-wet, and the detection range was 1,800 ~ 2,300pg/g-wet.

[3] Aldrin (references)

・ History and state of monitoring

Aldrin had been used as a soil insecticide until FY1971 when the application of the substance was substantially stopped. Its registration under the Agricultural Chemicals Regulation Law was expired in FY1975. It was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in October 1981. Also the substance is the initial POPs under the Stockholm Convention since 2004.

In previous monitoring series until FY2001, the substance was monitored in wildlife (bivalves, fish and birds) during the period of FY1978~1989, FY1991 and FY1993 under the framework of "the Wildlife Monitoring."

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water sediment wildlife (bivalves, fish and birds) and air in FY2002~2009, in wildlife (bivalves, fish and birds) and air in FY2014, and in sediment in FY2018.

No monitoring was conducted after FY2019. For reference, the monitoring results up to FY2018 are given below.

・ Monitoring results until FY2018

(Note) No monitoring was conducted during FY2010~2013.

[4] Dieldrin (references)

・ History and state of monitoring

Dieldrin was used as a pesticide and its application culminated during the period of 1955~1964. The substance had been used as termitecides as a Soil-Residue-Prone Pesticide under the Agricultural Chemicals Regulation Law in 1971, but its registration under the Agricultural Chemicals Regulation Law was expired in FY1975. It had been used for termite control and was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in October 1981. Also the substance is one of the original twelve POPs covered by the Stockholm Convention.

In previous monitoring series until FY2001, the substance was monitored in wildlife (bivalves, fish and birds) during the period of FY1978~1996, FY1998, FY2000 and FY2001 under the framework of “the Wildlife Monitoring.” Under the framework of “the Surface Water/Sediment Monitoring,” the substance in surface water and sediment was monitored during the period of FY1986~1998 and FY1986~2001, respectively.

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water sediment wildlife (bivalves, fish and birds) and air in FY2002~2009 and FY2011, in surface water wildlife (bivalves, fish and birds) and air in FY2014, and in sediment in FY2018.

No monitoring was conducted after FY2019. For reference, the monitoring results up to FY2018 are given below.

・ Monitoring results until FY2018

<Surface Water>

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.

(Note 2) *2: There is no consistency between the results of the ornithological survey in FY2014 and those in previous years because of the changes in the survey sites and target species.

(Note 3) No monitoring was conducted in FY2010, FY2012 and FY2013.

(Note) No monitoring was conducted in FY2010, FY2012 and FY2013.

[6] DDTs (references)

・ History and state of monitoring

DDT, along with hexachlorocyclohexanes (HCHs) and drins, was used as insecticides in high volume. Its registration under the Agricultural Chemicals Regulation Law was expired in FY1971. *p,p'*-DDT was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in October 1981. Also the substances are one of the original twelve POPs covered by the Stockholm Convention.

Among several DDT isomers with chlorine at various positions on the aromatic ring, not only *p,p'*-DDT and *o,p'*-DDT as active substances but also *p,p'*-DDE, *o,p'*-DDE, *p,p'*-DDD and *o,p'*-DDD as the environmentally degraded products of DDTs have been the target chemicals in monitoring series since FY1978.

In previous monitoring series, *p,p'*-DDT, *p,p'*-DDE and *p,p'*-DDD had been monitored in wildlife (bivalves, fish and birds) during the period of FY1978~2001 under the framework of "the Wildlife Monitoring." Under the framework of "the Surface Water/Sediment Monitoring," surface water and sediment had been the monitored media during the period of FY1986~1998 and FY1986~2001, respectively. Similarly, *o,p'*-DDT, *o,p'*-DDE and *o,p'*-DDD had been monitored in wildlife (bivalves, fish and birds) during the period of FY1978~1996 and in FY1998, FY2000 and FY2001 under the framework of "the Wildlife Monitoring."

Under the framework of the Environmental Monitoring, *p,p'*-DDT *p,p'*-DDE *p,p'*-DDD *o,p'*-DDT *o,p'*-DDE and *o,p'*-DDD have been monitored in surface water and sediment in FY2002~2010 FY2014 and FY2021, in wildlife (bivalves, fish and birds) in FY2002~2010 FY2013 FY2018 and FY2021, and air in FY2002~2010 FY2013 FY2015 FY2018 and FY2021.

No monitoring was conducted in FY2022. For reference, the monitoring results up to FY2021 are given below.

・ Monitoring results until FY2021

○ *p,p'*-DDT, *p,p'*-DDE and *p,p'*-DDD

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.
(Note 2) *2: There is no consistency between the results of the ornithological survey in FY2013 and those in previous years because of the changes in the survey sites and target species.
(Note 3) No monitoring was conducted in FY2011, FY2012, FY2014~2017, FY2019 and FY2020.

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.

(Note2) *2: There is no consistency between the results of the ornithological survey in FY2013 and those in previous years because of the changes in the survey sites and target species.

(Note 3) No monitoring was conducted in FY2011, FY2012, FY2014~2017, FY2019 and 2020.

(Note) No monitoring was conducted in FY2011, FY2012, FY2014, FY2016, FY2017, FY2019 and FY2020.

[7] Chlordanes (references)

・ History and state of monitoring

Chlordane was used as insecticides on a range of agricultural crops, but the registration of Chlordanes under the Agricultural Chemicals Regulation Law was expired in FY1968. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in September 1986 because of its properties such as persistency, since it had been used as termitecides for wood products such as primary processed timber, plywood and house. Also, *cis*-Chlordane and *trans*-Chlordane are one of the original twelve POPs covered by the Stockholm Convention.

Although manufactured Chlordanes have complicated compositions, Heptachlor, *γ*-Chlordane, Heptachlor epoxide, *cis*-Chlordane, *trans*-Chlordane, Oxychlordane (as a chlordane metabolite), *cis*-Nonachlor (not registrated as an Agricultural Chemical) and *trans*-Nonachlor (not registrated as an Agricultural Chemical) were the original target chemicals in monitoring series. Since FY1983, 5 of those 8 chemicals (*cis*-Chlordane, *trans*-Chlordane, Oxychlordane, *cis*-Nonachlor and *trans*-Nonachlor) have been the target chemicals owning to their high detection frequency in the FY1982 High-Precision Environmental Survey.

In previous monitoring series, Chlordanes had been monitored in wildlife (bivalves, fish and birds) during the period of FY1978~2001 under the framework of "the Wildlife Monitoring." Under the framework of "the Surface Water/Sediment Monitoring", *cis*-Chlordane, *trans*-Chlordane, *cis*-Nonachlor and *trans*-Nonachlor in surface water and sediment have been the monitored during the period of FY1986~1998 and FY1986~2001, respectively.

Under the framework of the Environmental Monitoring, *cis*-Chlordane *trans*-Chlordane Oxychlordane (as a Chlordane metabolite) *cis*-Nonachlor (not registrated as an Agricultural Chemical) and *trans*-Nonachlor have been monitored in surface water and sediment in FY2002~2013 FY2017 and FY2020, and in wildlife (bivalves, fish and birds) and air in FY2002~2013 FY2016 and FY2020.

No monitoring was conducted after FY2021. For reference, the monitoring results up to FY2020 are given below.

・ Monitoring results until FY2020

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.

(Note 2) *2: There is no consistency between the results of the ornithological survey after FY2013 and those in previous years because of the changes in the survey sites and target species.

(Note 3) No monitoring was conducted during FY2014, 2015 and FY2017~2019.

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.
(Note 2) *2: There is no consistency between the results of the ornithological survey after FY2013 and those in previous years because of the changes in the survey sites and target species.
(Note 3) No monitoring was conducted during FY2014, 2015 and FY2017~2019.

(Note) No monitoring was conducted in FY2014, FY2015 and FY2017~2019.

[8] Heptachlors (references)

・ History and state of monitoring

Heptachlor and its metabolite, Heptachlor epoxide, used to kill soil insects and termites, heptachlor has also been used more widely to kill cotton insects, grasshoppers, other crop pests, and malaria-carrying mosquitoes. The substances were not registrated under the Agricultural Chemicals Regulation Law in FY1975. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in September 1986, since it includes the technical chlordane used as a termitecide. Also Heptachlors are one of the original twelve POPs covered by the Stockholm Convention.

In previous monitoring series before FY2001, Heptachlor and Heptachlor epoxide were measured in FY1982 (in surface water, sediment and fish) and in FY1986 (in air) under the framework of "the Environmental Survey and Monitoring of Chemicals."

Under the framework of the Environmental Monitoring, Heptachlor in surface water sediment wildlife (bibalves, fish and birds) and air had been monitored since FY2002, and *cis*-Heptachlor epoxide and *trans*-Heptachlor epoxide had also been monitored since FY2003, every year through FY2011. After FY2012, the substances have been monitored in surface water and sediment in FY2014 FY2017 and FY2020, and in wildlife (bivalves, fish and birds) and air in FY2012 FY2013 FY2015 FY2016 and FY2020.

No monitoring was conducted after FY2021. For reference, the monitoring results up to FY2020 are given below.

・ Monitoring results until FY2020

<Surface Water>

Stocktaking of the detection of Heptachlor, *cis*-Heptachlor epoxide and *trans*-Heptachlor epoxide in surface water during FY2002~2020

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002~2009.
(Note 2) *2: There is no consistency between the results of the ornithological survey after FY2013 and those in previous years because of the changes in the survey sites and target species.
(Note 3) No monitoring was conducted in FY2014 and FY2017~2019.

(Note) No monitoring was conducted in FY2014 and FY2017~2019.

[9] Toxaphenes (references)

・ History and state of monitoring

Toxaphenes are a group of organochlorine insecticides used on cotton, cereal grains, fruits, nuts, and vegetables and also it has also been used to control ticks and mites in livestock. No domestic record of manufacture/import of the substances was reported since those were historically never registrated under the Agricultural Chemicals Regulation Law. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in September 2002. Also, Toxaphenes are one of the original twelve POPs covered by the Stockholm Convention.

In previous monitoring series before FY2001, total amount of Toxaphenes was measured in FY1983 (in surface water and sediment) under the framework of “the Environmental Survey and Monitoring of Chemicals.”

Under the framework of the Environmental Monitoring, Parlar-26 Parlar-50 and Parlar-62 have been monitored in surface water sediment and air in FY2003~2009 and FY2018, and in wildlife (bivalves, fish and birds) in FY2003~2009 FY2015 and FY2018.

No monitoring was conducted after FY2019. For reference, the monitoring results up to FY2018 are given below.

・ Monitoring results until FY2018

(Note) No monitoring was conducted in FY2010~2017.

[10] Mirex (references)

・ History and state of monitoring

Mirex was developed as an organochlorine insecticide chemical in the United States, and it was also used as a fire retardant in plastics, rubber, and electrical goods. No domestic record of manufacture/import of the substance was reported since it was historically never registrated under the Agricultural Chemicals Regulation Law. The substance was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in September 2002. Also the substance is one of the original twelve POPs covered by the Stockholm Convention.

Before FY2001, the substance was measured in FY1983 (in surface water and sediment) under the framework of "the Environmental Survey and Monitoring of Chemicals."

Under the framework of the Environmental Monitoring, Mirex has been monitored in surface water sediment wildlife (bivalves, fish and birds) and air in FY2003~2009 FY2011 and FY2018.

No monitoring was conducted after FY2019. For reference, the monitoring results up to FY2018 are given below.

・ Monitoring results until FY2018

<Surface Water>

Stocktaking of the detection of Mirex in surface water during FY2003~2018

Mirex	Monitored year	Geometric mean	Median	Maximum	Minimum	Quantification [Detection] limit	Detection Frequency Sample	Detection Frequency Site

[11] HCHs

・ History and state of monitoring

HCHs were used as pesticides, household insecticides, and termiticides, etc. Even after their registration under the Agricultural Chemicals Regulation Law was expired in FY1971, they continue to be used as termiticides and wood preservatives. *α*-HCH, *β*-HCH, and *γ*-HCH (synonym: Lindane) were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants in May 2009. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010.

Among many HCH isomers, *α*-HCH, *β*-HCH, *γ*-HCH (synonym: Lindane) and *δ*-HCH have been monitored in surface water, sediment, wildlife (bivalves, fish and birds) and air.

Before FY2001, the substances were measured in FY1974 (in surface water, sediment and fish) under the framework of "the Environmental Survey and Monitoring of Chemicals." *α*-HCH and *β*-HCH had been the target chemicals, and surface water and sediment had been the monitored media during the period of FY1986~1998 and FY1986~2001, respectively. Under the framework of the Wildlife Monitoring, the substances were monitored in wildlife (bivalves, fish and birds) during the period of FY1978~1996 and in FY1998, FY2000 and FY2001 (*γ*-HCH (synonym: Lindane) and *δ*-HCH had not been monitored since FY1997 and FY1993, respectively.)

Under the framework of the Environmental Monitoring, *α*-HCH and *β*-HCH in surface water sediment and wildlife (bivalves, fish and birds) have been monitored FY2002~FY2017 FY2019 and FY2022. Since FY2003, *α*-HCH and *β*-HCH in air and *γ*-HCH (synonym: Lindane) and *δ*-HCH in surface water sediment wildlife (bivalves, fish and birds) and air have also been monitored.

・ Monitoring results

<Surface Water>

α-HCH: The presence of the substance in surface water was monitored at 48 sites, and it was detected at all 48 valid sites adopting the detection limit of 0.5pg/L, and the detection range was 1.9 ~ 430pg/L.

As results of the inter-annual trend analysis from FY2002 to FY2022, reduction tendencies in specimens from river areas, river mouth areas and sea areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

β-HCH: The presence of the substance in surface water was monitored at 48 sites, and it was detected at all 48 valid sites adopting the detection limit of 0.2pg/L, and the detection range was 9.5 ~ 540pg/L.

As results of the inter-annual trend analysis from FY2002 to FY2022, reduction tendencies in specimens from river areas, lake areas, river mouth areas and sea areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

γ-HCH (synonym: Lindane): The presence of the substance in surface water was monitored at 48 sites, and it was detected at all 48 valid sites adopting the detection limit of 0.3pg/L, and the detection range was tr(0.6) ~ 120pg/L.

As results of the inter-annual trend analysis from FY2003 to FY2022, reduction tendencies in specimens from river areas, lake areas, river mouth areas and sea areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

δ-HCH: The presence of the substance in surface water was monitored at 48 sites, and it was detected at 41 of the 48 valid sites adopting the detection limit of 0.7pg/L, and the detection range was up to 90pg/L.

As results of the inter-annual trend analysis from FY2003 to FY2022, a reduction tendency in specimens from river areas was identified as statistically significant. And the recent 7 years period was indicated lower concentration than the first 7 years period in specimens from the overall areas in surface water as statistically significant.

Stocktaking of the detection of Totalα-HCH, β-HCH, γ-HCH(synonym: Lindane) and δ-HCH in surface water during FY2002~2022

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2002.

(Note 2) No monitoring was conducted in FY2018 FY2020 and FY2021.

<Sediment>

α-HCH: The presence of the substance in sediment was monitored at 61 sites, and it was detected at all 61 valid sites adopting the detection limit of 0.3pg/g-dry, and the detection range was 1.2 ~ 2,800pg/g-dry.

As results of the inter-annual trend analysis from FY2002 to FY2022, reduction tendencies in specimens from river areas, river mouth areas and sea areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

β-HCH: The presence of the substance in sediment was monitored at 61 sites, and it was detected at all 61 valid sites adopting the detection limit of 0.6pg/g-dry, and the detection range was 2.2 ~ 2,900pg/g-dry.

As results of the inter-annual trend analysis from FY2002 to FY2022, a reduction tendency in specimens from river mouth areas was identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

γ-HCH (synonym: Lindane): The presence of the substance in sediment was monitored at 61 sites, and it was detected at all 61 valid sites adopting the detection limit of 0.5pg/g-dry, and the detection range was tr(0.7) ~ 2,100pg/g-dry.

As results of the inter-annual trend analysis from FY2002 to FY2022, reduction tendencies in specimens from river areas and sea areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

δ-HCH: The presence of the substance in sediment was monitored at 61 sites, and it was detected at all 61 valid sites adopting the detection limit of 0.3pg/g-dry, and the detection range was tr(0.6) ~ 2,300pg/g-dry.

As results of the inter-annual trend analysis from FY2002 to FY2022, reduction tendencies in specimens from river mouth areas and sea areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2002~2009.

(Note 2) No monitoring was conducted in FY2018 FY2020 and FY2021.

<Wildlife>

α-HCH: The presence of the substance in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 0.4pg/g-wet, and the detection range was 2.5 ~ 16pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 17 of the 18 valid areas adopting the detection limit of 0.4pg/g-wet, and the detection range was up to 82pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at all 2 valid areas adopting the detection limit of 0.4pg/g-wet, and the detection range was 35 ~ 63pg/g-wet.

As results of the inter-annual trend analysis from FY2002 to FY2022, reduction tendencies in specimens from bivalves and fish were identified as statistically significant.

β-HCH: The presence of the substance in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 0.4pg/g-wet, and the detection range was 10 ~ 35pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at all 18 valid areas adopting the detection limit of 0.4pg/g-wet, and the detection range was 2.2 ~ 230pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at all 2 valid areas adopting the detection limit of 0.4pg/g-wet, and the detection range was 970 ~ 1,300pg/g-wet.

As results of the inter-annual trend analysis from FY2002 to FY2022, a reduction tendency in specimens from fish was identified as statistically significant.

γ-HCH (synonym: Lindane): The presence of the substance in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 0.4pg/g-wet, and the detection range was tr(1.0) ~ 8.4pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 17 of the 18 valid areas adopting the detection limit of 0.4pg/g-wet, and the detection range was up to 24pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at all 2 valid areas adopting the detection limit of 0.4pg/g-wet, and the detection range was 1.8 ~ 6.6pg/g-wet.

As results of the inter-annual trend analysis from FY2003 to FY2022, a reduction tendency in specimens from bivalves was identified as statistically significant, and the recent 7 years period was indicated lower concentration than the first 7 years period in specimens from fish as statistically significant.

δ-HCH: The presence of the substance in bivalves was monitored in 3 areas, and it was detected at 2 of the 3 valid areas adopting the detection limit of 0.4pg/g-wet, and the detection range was up to 3.0pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 13 of the 18 valid areas adopting the detection limit of 0.4pg/g-wet, and the detection range was up to 5.5pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at all 2 valid areas adopting the detection limit of 0.4pg/g-wet, and the detection range was 1.2 ~ 2.1pg/g-wet.

Stocktaking of the detection of*α*-HCH, *β*-HCH, *γ*-HCH(synonym: Lindane) and *δ*-HCH in wildlife (bivalves, fish and birds) during FY2002~2022

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2002~2009.

(Note 2) *2: There is no consistency between the results of the ornithological survey after FY2013 and those in previous years because of the changes in the survey sites and target species.

(Note 3) No monitoring was conducted in FY2018 FY2020 and FY2021.

<Air>

α-HCH: The presence of the substance in air was monitored at 36 sites and, excluding 2 sites whose concentrations were treated as invalid, it was detected at all 34 valid sites adopting the detection limit of 0.04pg/m^3, and the detection range was 2.9 ~ 100pg/m^3.

As a result of the inter-annual trend analysis from FY2009 to FY2022, a reduction tendency in specimens from warm season was identified as statistically significant.

β-HCH: The presence of the substance in air was monitored at 36 sites and, excluding 2 sites whose concentrations were treated as invalid, it was detected at all 34 valid sites adopting the detection limit of 0.03pg/m^3, and the detection range was 0.23 ~ 14pg/m^3.

As a result of the inter-annual trend analysis from FY2009 to FY2022, a reduction tendency in specimens from warm season was identified as statistically significant.

γ-HCH (synonym: Lindane): The presence of the substance in air was monitored at 36 sites and, excluding 2 sites whose concentrations were treated as invalid, it was detected at all 34 valid sites adopting the detection limit of 0.03pg/m^3, and the detection range was 0.63 ~ 22pg/m^3.

As a result of the inter-annual trend analysis from FY2009 to FY2022, a reduction tendency in specimens from warm season was identified as statistically significant.

δ-HCH: The presence of the substance in air was monitored at 36 sites and, excluding 2 sites whose concentrations were treated as invalid, it was detected at 32 of the 34 valid sites adopting the detection limit of 0.03pg/m^3, and the detection range was up to 12pg/m^3.

As a result of the inter-annual trend analysis from FY2009 to FY2022, a reduction tendency in specimens from warm season was identified as statistically significant.

Stocktaking of the detection of*α*-HCH, *β*-HCH, *γ*-HCH (synonym: Lindane) and *δ*-HCH in air during FY2002~2022

(Note) No monitoring was conducted in FY2018 FY2020 and FY2021.

[12] Chlordecone (reference)

・ History and state of monitoring (reference)

Chlordecone is a synthetic chlorinated organic compound, which was mainly used as an agricultural pesticide. No domestic record of manufacture/import of the substance was reported since it was historically never registrated under the Agricultural Chemicals Regulation Law. Chlordecone was adopted as a target chemical at the Fourth Meeting of the Conference of Parties (COP4) on Stockholm convention on Persistent Organic Pollutants in May 2009 and designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010.

As a continuous survey, the first survey was in FY2008. In the Initial Environmental Survey and the Detailed Environmental Survey etc. under the framework of the Environmental Survey and Monitoring of Chemicals after FY2002, the substance was monitored in air in FY2003.

Under the framework of the Environmental Monitoring, the substance was monitored in surface water sediment and wildlife (bivalves, fish and birds) in FY2008 FY2010 and FY201, and in air in FY2010 and FY2011.

No monitoring was conducted after FY2012. For reference, the monitoring results up to FY2011 are given below.

・ Monitoring results until FY2011

<Surface Water>

Stocktaking of the detection of Chlordecone in surface water during FY2008~2011

Chlordecone	Monitored year	Geometric mean	Median	Maximum	Minimum	Quantification [Detection] limit	Detection Frequency Sample	Detection Frequency Site

[13] Hexabromobiphenyls (reference)

・ History and state of monitoring

Hexabromobiphenyls are industrial chemicals that have been used as flame retardans. Hexabromobiphenyls were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants in May 2009 and designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010.

As a continuous survey, the first survey was in FY2009. Under the framework of the Environmental Survey of Chemical Substances up to FY2001, the substance was monitored in surface water, sediment, wildlife (fish) and air in FY1989. Under the framework of the Initial Environmental Survey and the Detailed Environmental Survey etc. in the Environmental Survey and Monitoring of Chemicals after FY2002, the substance was monitored surface water and sediment in FY2003, in air in FY2004.

Under the framework of the Environmental Monitoring, the substances has been monitored in surface water in FY2009 FY2010 and FY2011, in sediment and wildlife (bivalves, fish and birds) in FY2009 FY2010 FY2011 and FY2015, and in air in FY2010 2011 and FY2015.

No monitoring was conducted after FY2016. For reference, the monitoring results up to FY2015 are given below.

・ Monitoring results until FY2015

<Surface Water>

Stocktaking of the detection of Hexabromobiphenyls in surface water during FY2009~2011

	2015	---	---	nd	nd	14 [5]	0/1	0/1

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2009.

(Note 2) *2: The sum value of the Quantification [Detection] limits of each congener in FY2009 and FY2010.

(Note 3) *3: There is no consistency between the results of the ornithological survey in FY2015 and those in previous years because of the changes in the survey sites and target species.

(Note 4) No monitoring was conducted during FY2012~2014.

<Air>

Stocktaking of the detection of Hexabromobiphenyls in air during FY2010~2015

[14] Polybromodiphenyl ethers (Br_4~Br_{10}) (reference)

・ History and state of monitoring

Polybrominated diphenyl ethers have been used as flame retardants for plastics products. Tetrabromodiphenyl ethers, Pentabromodiphenyl ethers, Hexabromodiphenyl ethers, and Heptabromodiphenyl ethers were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants in May 2009. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010. Also, Decabromodiphenyl ether was adopted as target chemicals at the COP8 of the Stockholm convention on Persistent Organic Pollutants held from late April to early May 2017.The substance was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2018.

As a continuous survey, the first survey was in FY2008. Under the framework of the Environmental Survey of Chemical Substances up to FY2001, Decabromodiphenyl ether was monitored in surface water and sediment in FY1977 and FY1996, Polybromodiphenyl ethers (Br_6, Br_8 and Br_{10}) were monitored in surface water, sediment and wildlife (fish) in FY1987 and FY1988, Polybromodiphenyl ethers (Br_1~Br_7) were monitored in air in FY2001.In the Initial Environmental Survey and the Detailed Environmental Survey etc. under the framework of the Environmental Survey and Monitoring of Chemicals after FY2002, Decabromodiphenyl ether was monitored in surface water, sediment and wildlife (fish) in FY2002, Polybromodiphenyl ethers (Br_6, Br_8 and Br_{10}) were monitored in sediment and wildlife (fish) in FY2003, Pentabromodiphenyl ethers were monitored in sediment and Polybromodiphenyl ethers (Br_1~Br_7) in air in FY2004, Polybromodiphenyl ethers (Br_1~Br_7, Br_9 and Br_{10}) were monitored in surface water in FY2005.

Under the framework of the Environmental Monitoring, Polybromodiphenyl ethers (Br_4~Br_{10}) have been monitored in surface water sediment and air in FY2009~2012 FY2014~2019 and FY2022, and in wildlife (bivalves, fish and birds) in FY2008 FY2010~2012 FY2014~2019 and FY2022.

・ Monitoring results

<Surface Water>

Tetrabromodiphenyl ethers: The presence of the substances in surface water was monitored at 48 sites, and it was detected at all 48 valid sites adopting the detection limit of 2pg/L, and the detection range was tr(2) ~ 140pg/L.

As results of the inter-annual trend analysis from FY2009 to FY2022, although the number of detections was small, the detection rates of river area, sea area and all areas in surface water were decreased, it suggested reduction tendencies of the concentrations.

Pentabromodiphenyl ethers: The presence of the substances in surface water was monitored at 48 sites, and it was detected at 40 of the 48 valid sites adopting the detection limit of 0.9pg/L, and the detection range was up to 31pg/L.

As results of the inter-annual trend analysis from FY2009 to FY2022, although the number of detections was small, the detection rates of river area, river mouth area, sea area and all areas in surface water were decreased, it suggested reduction tendencies of the concentrations.

Hexabromodiphenyl ethers: The presence of the substances in surface water was monitored at 48 sites, and it was detected at 5 of the 48 valid sites adopting the detection limit of 1pg/L, and the detection range was up to 10pg/L.

As results of the inter-annual trend analysis from FY2009 to FY2022, although the number of detections was small, the detection rates of river area, river mouth area and sea area in surface water were decreased, it suggested reduction tendencies of the concentrations.

Heptabromodiphenyl ethers: The presence of the substances in surface water was monitored at 48 sites, and it was detected at 1 of the 48 valid sites adopting the detection limit of 3pg/L, and the detected concentration was tr(6)pg/L.

As results of the inter-annual trend analysis from FY2009 to FY2022, although the number of detections was small, the detection rates of river area, river mouth area and sea area in surface water were decreased, it suggested reduction tendencies of the concentrations.

Octabromodiphenyl ethers: The presence of the substances in surface water was monitored at 48 sites, and it was detected at 17 of the 48 valid sites adopting the detection limit of 0.8pg/L, and the detection range was up to 26pg/L.

As results of the inter-annual trend analysis from FY2009 to FY2022, although the number of detections was small, the detection rate of all area in surface water was decreased, it suggested a reduction tendency of the concentrations.

Nonabromodiphenyl ethers: The presence of the substances in surface water was monitored at 48 sites, and it was detected at 25 of the 48 valid sites adopting the detection limit of 4pg/L, and the detection range was up to 670pg/L.

Decabromodiphenyl ether: The presence of the substance in surface water was monitored at 48 sites, and it was detected at all 48 valid sites adopting the detection limit of 3pg/L, and the detection range was tr(7) ~ 5,600pg/L.

(Note) No monitoring was conducted in FY2013 FY2020 and FY2021.

<Sediment>

Tetrabromodiphenyl ethers: The presence of the substances in sediment was monitored at 61 sites, and it was detected at 52 of the 61 valid sites adopting the detection limit of 0.9pg/g-dry, and the detection range was up to 1,800pg/g-dry.

As results of the inter-annual trend analysis from FY2009 to FY2022, although the number of detections was small, the detection rate of river area in sediment was decreased, it suggested a reduction tendency of the concentrations.

Pentabromodiphenyl ethers: The presence of the substances in sediment was monitored at 61 sites, and it was detected at 45 of the 61 valid sites adopting the detection limit of 1pg/g-dry, and the detection range was up to 850pg/g-dry.

As results of the inter-annual trend analysis from FY2009 to FY2022, although the number of detections was small, the detection rate of river area in sediment was decreased, it suggested a reduction tendency of the concentrations.

Hexabromodiphenyl ethers: The presence of the substances in sediment was monitored at 61 sites, and it was detected at 46 of the 61 valid sites adopting the detection limit of 1pg/g-dry, and the detection range was up to 420pg/g-dry.

As results of the inter-annual trend analysis from FY2009 to FY2022, although the number of detections was small, the detection rate of river area in sediment was decreased, it suggested a reduction tendency of the concentrations.

Heptabromodiphenyl ethers: The presence of the substances in sediment was monitored at 61 sites, and it was detected at 39 of the 61 valid sites adopting the detection limit of 3pg/g-dry, and the detection range was up to 940pg/g-dry.

As results of the inter-annual trend analysis from FY2009 to FY2022, although the number of detections was small, the detection rate of river area in sediment was decreased, it suggested a reduction tendency of the concentrations.

Octabromodiphenyl ethers: The presence of the substances in sediment was monitored at 61 sites, and it was detected at 45 of the 61 valid sites adopting the detection limit of 3pg/g-dry, and the detection range was up to 1,600pg/g-dry.

As results of the inter-annual trend analysis from FY2009 to FY2022, although the number of detections was small, the detection rate of river area in sediment was decreased, it suggested a reduction tendency of the concentrations.

Nonabromodiphenyl ethers: The presence of the substances in sediment was monitored at 61 sites, and it was detected at 56 of the 61 valid sites adopting the detection limit of 5pg/g-dry, and the detection range was up to 43,000pg/g-dry.

Decabromodiphenyl ether: The presence of the substance in sediment was monitored at 61 sites, and it was detected at all 61 valid sites adopting the detection limit of 8pg/g-dry, and the detection range was tr(17) ~ 410,000pg/g-dry.

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2009.

(Note 2) No monitoring was conducted in FY2013 FY2020 and FY2021.

<Wildlife>

Tetrabromodiphenyl ethers: The presence of the substances in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 5pg/g-wet, and the detection range was tr(6) ~ 94pg/g-wet. For fish, The presence of the substances was monitored in 18 areas, and it was detected at all 18 valid areas adopting the detection limit of 5pg/g-wet, and the detection range was tr(6) ~ 230pg/g-wet. For birds, The presence of the substances was monitored in 2 areas, and it was detected at all 2 valid areas adopting the detection limit of 5pg/g-wet, and the detection range was 180 ~ 250pg/g-wet.

As results of the inter-annual trend analysis from FY2008 to FY2022, reduction tendencies in specimens from bivalves and fish were identified as statistically significant.

Pentabromodiphenyl ethers: The presence of the substances in bivalves was monitored in 3 areas, and it was detected at 2 of the 3 valid areas adopting the detection limit of 2pg/g-wet, and the detection range was up to 26pg/g-wet. For fish, The presence of the substances was monitored in 18 areas, and it was detected at 17 of the 18 valid areas adopting the detection limit of 2pg/g-wet, and the detection range was up to 82pg/g-wet. For birds, The presence of the substances was monitored in 2 areas, and it was detected at all 2 valid areas adopting the detection limit of 2pg/g-wet, and the detection range was 200 ~ 260pg/g-wet.

As results of the inter-annual trend analysis from FY2008 to FY2022, reduction tendencies in specimens from bivalves and fish were identified as statistically significant.

Hexabromodiphenyl ethers: The presence of the substances in bivalves was monitored in 3 areas, and it was detected at 1 of the 3 valid areas adopting the detection limit of 2pg/g-wet, and the detected concentration was 5pg/g-wet. For fish, The presence of the substances was monitored in 18 areas, and it was detected at 17 of the 18 valid areas adopting the detection limit of 2pg/g-wet, and the detection range was up to 96pg/g-wet. For birds, The presence of the substances was monitored in 2 areas, and it was detected at all 2 valid areas adopting the detection limit of

2pg/g-wet, and the detection range was 240 ~ 480pg/g-wet.

As results of the inter-annual trend analysis from FY2008 to FY2022, a reduction tendency in specimens from fish was identified as statistically significant.

Heptabromodiphenyl ethers: The presence of the substances in bivalves was monitored in 3 areas, and it was not detected at all 3 valid areas adopting the detection limit of 4pg/g-wet. For fish, The presence of the substances was monitored in 18 areas, and it was detected at 4 of the 18 valid areas adopting the detection limit of 4pg/g-wet, and the detection range was up to tr(8)pg/g-wet. For birds, The presence of the substances was monitored in 2 areas, and it was detected at all 2 valid areas adopting the detection limit of 4pg/g-wet, and the detection range was 49 ~ 96pg/g-wet.

Octabromodiphenyl ethers: The presence of the substances in bivalves was monitored in 3 areas, and it was detected at 1 of the 3 valid areas adopting the detection limit of 1pg/g-wet, and the detected concentration was tr(1)pg/g-wet. For fish, The presence of the substances was monitored in 18 areas, and it was detected at 13 of the 18 valid areas adopting the detection limit of 1pg/g-wet, and the detection range was up to 29pg/g-wet. For birds, The presence of the substances was monitored in 2 areas, and it was detected at all 2 valid areas adopting the detection limit of 1pg/g-wet, and the detection range was 150 ~ 180pg/g-wet.

Nonabromodiphenyl ethers: The presence of the substances in bivalves was monitored in 3 areas, and it was not detected at all 3 valid areas adopting the detection limit of 4pg/g-wet. For fish, The presence of the substances was monitored in 18 areas, and it was not detected at all 18 valid areas adopting the detection limit of 4pg/g-wet. For birds, The presence of the substances was monitored in 2 areas, and it was detected at 1 of the 2 valid areas adopting the detection limit of 4pg/g-wet, and the detected concentration was 10pg/g-wet.

As results of the inter-annual trend analysis from FY2008 to FY2022, although the number of detections was small, the detection rate of specimens from fish was decreased, it suggested a reduction tendency of the concentrations.

Decabromodiphenyl ether: The presence of the substance in bivalves was monitored in 3 areas, and it was detected at 1 of the 3 valid areas adopting the detection limit of 5pg/g-wet, and the detected concentration was 15pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 1 of the 18 valid areas adopting the detection limit of 5pg/g-wet, and the detected concentration was tr(7)pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at 1 of the 2 valid areas adopting the detection limit of 5pg/g-wet, and the detected concentration was tr(9)pg/g-wet.

As results of the inter-annual trend analysis from FY2008 to FY2022, although the number of detections was small, the detection rate of specimens from fish was decreased, it suggested a reduction tendency of the concentrations.

Stocktaking of the detection of Polybromodiphenyl ethers (Br_4~Br_{10}) in wildlife (bivalves, fish and birds) during FY2008~2022

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2008.

(Note 2) *2: There is no consistency between the results of the ornithological survey after FY2014 and those in previous years because of the changes in the survey sites and target species.

(Note 3) No monitoring was conducted in FY2009 FY2013 FY2020 and FY2021.

<Air>

Tetrabromodiphenyl ethers: The presence of the substances in air was monitored at 36 sites, and it was detected at 20 of the 36 valid sites adopting the detection limit of 0.2pg/m^3, and the detection range was up to 1.1pg/m^3.

As a result of the inter-annual trend analysis from FY2009 to FY2022, a reduction tendency in specimens from warm season was identified as statistically significant.

Pentabromodiphenyl ethers: The presence of the substances in air was monitored at 36 sites, and it was detected at 13 of the 36 valid sites adopting the detection limit of 0.05pg/m^3, and the detection range was up to 0.31pg/m^3.

As a result of the inter-annual trend analysis from FY2009 to FY2022, although the number of detections was small, the detection rate of specimens from warm season was decreased, it suggested a reduction tendency of the concentrations.

Hexabromodiphenyl ethers: The presence of the substances in air was monitored at 36 sites, and it was detected at 1 of the 36 valid sites adopting the detection limit of 0.2pg/m^3, and the detected concentration was 0.6pg/m^3.

As a result of the inter-annual trend analysis from FY2009 to FY2022, although the number of detections was small, the detection rate of specimens from warm season was decreased, it suggested a reduction tendency of the concentrations.

Heptabromodiphenyl ethers: The presence of the substances in air was monitored at 36 sites, and it was detected at 1 of the 36 valid sites adopting the detection limit of 0.2pg/m^3, and the detected concentration was 1.0pg/m^3.

As a result of the inter-annual trend analysis from FY2009 to FY2022, although the number of detections was small, the detection rate of specimens from warm season was decreased, it suggested a reduction tendency of the concentrations.

Octabromodiphenyl ethers: The presence of the substances in air was monitored at 36 sites, and it was detected at 12 of the 36 valid sites adopting the detection limit of 0.1pg/m^3, and the detection range was up to 0.4pg/m^3.

As a result of the inter-annual trend analysis from FY2009 to FY2022, although the number of detections was small, the detection rate of specimens from warm season was decreased, it suggested a reduction tendency of the concentrations.

Nonabromodiphenyl ethers: The presence of the substances in air was monitored at 36 sites, and it was detected at 15 of the 36 valid sites adopting the detection limit of 0.3pg/m^3, and the detection range was up to 1.0pg/m^3.

As a result of the inter-annual trend analysis from FY2009 to FY2022, although the number of detections was small, the detection rate of specimens from warm season was decreased, it suggested a reduction tendency of the concentrations.

Decabromodiphenyl ether: The presence of the substance in air was monitored at 36 sites, and it was detected at 33 of the 36 valid sites adopting the detection limit of 0.3pg/m^3, and the detection range was up to 16pg/m^3.

As a result of the inter-annual trend analysis from FY2009 to FY2022, although the number of detections was small, the detection rate of specimens from warm season was decreased, it suggested a reduction tendency of the concentrations.

Stocktaking of the detection of Polybromodiphenyl ethers (Br_4~Br_{10}) in air during FY2008~2022

[15] Perfluorooctane sulfonic acid (PFOS)

・ History and state of monitoring

Perfluorooctane sulfonic acid (PFOS) has been used as electric and electronic parts, fire fighting foam, photo imaging, hydraulic fluids and textiles. Perfluorooctane sulfonic acid, its salts and perfluorooctane sulfonyl fluoride were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants in May 2009, and designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010.

As a continuous survey, the first survey was in FY2008. Under the framework the Initial Environmental Survey and the Detailed Environmental Survey etc. in the Environmental Survey and Monitoring of Chemicals after FY2002, the substance was monitored in surface water in FY2002, sediment and wildlife (fish) in FY2003, air in FY2004, surface water, sediment and wildlife (bivalves and fish) in FY2005.

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water and sediment in FY2009~2012 FY2014~2016 and FY2018~2022, in wildlife (bivalves, fish and birds) in FY2009~2012 FY2014~2017 and FY2019~2022,and in air in FY2010~2017 and FY2019~2022.

・ Monitoring results

<Surface Water>

The presence of the substance in surface water was monitored at 48 sites, and it was detected at 46 of the 48 valid sites adopting the detection limit of 30pg/L, and the detection range was up to 3,600pg/L.

As results of the inter-annual trend analysis from FY2009 to FY2022, a reduction tendencies in specimens from lake areas and sea areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

(Note) No monitoring was conducted in FY2013 and FY2017.

<Sediment>

The presence of the substance in sediment was monitored at 61 sites, and it was detected at all 61 valid sites adopting the detection limit of 4pg/g-dry, and the detection range was tr(5) ~ 710pg/g-dry.

As results of the inter-annual trend analysis from FY2009 to FY2022, reduction tendencies in specimens from river mouth areas and sea areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in sediment was also identified as statistically significant.

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2009.
(Note 2) No monitoring was conducted in FY2013 and FY2017.

<Wildlife>

The presence of the substance in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 3pg/g-wet, and the detection range was 9 ~ 160pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at all 18 valid areas adopting the detection limit of 3pg/g-wet, and the detection range was 9 ~ 7,200pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at all 2 valid areas adopting the detection limit of 3pg/g-wet, and the detection range was 5,200 ~ 100,000pg/g-wet.

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2009.
(Note 2) *2: There is no consistency between the results of the ornithological survey after FY2014 and those in previous years because of the changes in the survey sites and target species.
(Note 3) No monitoring was conducted in FY2013 and FY2018.

<Air>

The presence of the substance in air was monitored at 36 sites, and it was detected at all 36 valid sites adopting the detection limit of 0.07pg/m^3, and the detection range was 2.4 ~ 17pg/m^3.

As a result of the inter-annual trend analysis from FY2010 to FY2022, a reduction tendency in specimens from warm season was identified as statistically significant.

[16] Perfluorooctanoic acid (PFOA)

・ History and state of monitoring

Perfluorooctanoic acids (PFOA) have been used as water repellent agent, oil repellent agent and surface acting agent. PFOA, its salts and PFOA-related compounds were adopted as target chemicals at the COP9 of the Stockholm convention on Persistent Organic Pollutants held from late April to early May 2019. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2021.

As a continuous survey, the first survey was in FY2009. Under the framework of the Environmental Survey and Monitoring of Chemicals after FY2002, the Initial Environmental Survey and the Detailed Environmental Survey etc., the substance was monitored in surface water in FY2002, sediment and wildlife (fish) in FY2003, air in FY2004, surface water, sediment and wildlife (bivalves and fish) in FY2005.

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water and sediment in FY2009~2012 FY2014~2016 and FY2018~2022, in wildlife (bivalves, fish and birds) in FY2009~2012 FY2014~2017 and FY2019~2022, and in air in FY2010~2017 and FY2019~2022.

・ Monitoring results

<Surface Water>

The presence of the substance in surface water was monitored at 48 sites, and it was detected at all 48 valid sites adopting the detection limit of 30pg/L, and the detection range was 170 ~ 14,000pg/L.

As results of the inter-annual trend analysis from FY2009 to FY2022, reduction tendencies in specimens from river areas, lake areas and river mouth areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

	2019	21	22	190	tr(3)	5 [2]	61/61	61/61
	2020	21	22	190	nd	8 [3]	57/58	57/58
	2021	24	26	260	nd	9 [4]	58/60	58/60
	2022	29	26	370	tr(5)	7 [3]	61/61	61/61

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2009.

(Note 2) No monitoring was conducted in FY2013 and FY2017.

<Wildlife>

The presence of the substance in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 3pg/g-wet, and the detection range was tr(5) ~ 35pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 17 of the 18 valid areas adopting the detection limit of 3pg/g-wet, and the detection range was up to 47pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at all 2 valid areas adopting the detection limit of 3pg/g-wet, and the detection range was 470 ~ 2,600pg/g-wet.

As results of the inter-annual trend analysis from FY2009 to FY2022, although the number of detections was small, the detection rate of specimens from fish was decreased, it suggested a reduction tendency of the concentrations.

Stocktaking of the detection of Perfluorooctanoic acid (PFOA) in wildlife (bivalves, fish and birds) during FY2009~2022

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2009.

(Note 2) *2: There is no consistency between the results of the ornithological survey after FY2014 and those in previous years because of the changes in the survey sites and target species.

(Note 3) No monitoring was conducted in FY2013 and FY2018.

<Air>

The presence of the substance in air was monitored at 36 sites, and it was detected at all 36 valid sites adopting the detection limit of 0.2pg/m^3, and the detection range was 8.2 ~ 53pg/m^3.

As a result of the inter-annual trend analysis from FY2010 to FY2022, a reduction tendency in specimens from warm season was identified as statistically significant.

Stocktaking of the detection of Perfluorooctanoic acid (PFOA) in air during FY2010~2022

(Note) No monitoring was conducted in FY2018.

[17] Pentachlorobenzene

・ History and state of monitoring

Pentachlorobenzene have been used as used in PCB products, in dyestuff carriers, as a fungicide, a flame retardant and as a chemical intermediate e.g. previously for the production of quintozene. PeCB might still be used as an intermediate. PeCB is also produced unintentionally during combustion, thermal and industrial processes. It also present as impurities in products such as solvents or pesticides.It was historically never registered under the Agricultural Chemicals Regulation Law. The substance is produced as a by-product when agricultural chemicals are produced. In addition, it is generated unintentionally at the time of combustion. The substance was adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants in May 2009 and designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010.

As a continuous survey to FY2001, undert the framework "the Wildlife Monitoring of Chemicals," the substance was monitored in wildlife (bivalves and fish) in FY1980, wildlife (bivalves, fish and birds) from FY1979 to FY1986, in FY1988, FY1990, FY1992, FY1996 and FY1999.

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water in FY2007 FY2010~2015 and FY2017~2022, in sediment and wildlife (bivalves, fish and birds) in FY2007 and FY2010~2022, and in air in FY2007, FY2009~2022.

・ Monitoring results

<Surface Water>

The presence of the substance in surface water was monitored at 48 sites, and it was detected at all 48 valid sites adopting the detection limit of 0.2pg/L, and the detection range was 0.9 ~ 51pg/L.

As a result of the inter-annual trend analysis from FY2010 to FY2021, a reduction tendency in specimens from river areas was identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant..

Stocktaking of the detection of Pentachlorobenzene in surface water during FY2007~2022

Pentachlorobenzene	Monitored year	Geometric mean	Median	Maximum	Minimum	Quantification [Detection] limit	Detection Frequency

(Note) No monitoring was conducted in FY2008, FY2009 and FY2016.

<Sediment>

The presence of the substance in sediment was monitored at 61 sites, and it was detected at all 61 valid sites adopting the detection limit of 0.2pg/g-dry, and the detection range was tr(0.5) ~ 1,300pg/g-dry.

As a result of the inter-annual trend analysis from FY2010 to FY2021, a reduction tendency in specimens from river areas was identified as statistically significant and a reduction tendency in specimens from the overall areas in sediment was also identified as statistically significant..

Stocktaking of the detection of Pentachlorobenzene in sediment during FY2007~2022

Pentachlorobenzene	Monitored year	Geometric mean *	Median	Maximum	Minimum	Quantification [Detection] limit	Detection Frequency

	2022	24	25	1,300	tr(0.5)	0.6 [0.2]	61/61	61/61

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2007.

(Note 2) No monitoring was conducted in FY2008 and FY2009.

<Wildlife>

The presence of the substance in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 0.2pg/g-wet, and the detection range was 1.9 ~ 9.8pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at all 18 valid areas adopting the detection limit of 0.2pg/g-wet, and the detection range was 3.6 ~ 78pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at all 2 valid areas adopting the detection limit of 0.2pg/g-wet, and the detection range was 260 ~ 330pg/g-wet.

As results of the inter-annual trend analysis from FY2010 to FY2021, although the number of detections was small, the detection rate of specimens from the bivalves was decreased, it suggested a reduction tendency of the concentrations.

(Note) No monitoring was conducted in FY2008.

[18] Endosulfans (references)

・ History and state of monitoring

Endosulfans had been used an insecticide that has been used since the 1950s to control crop pests, tsetse flies and ectoparasites of cattle and as a wood preservative. Endosulfans were adopted as target chemicals at the COP5 of the Stockholm convention on Persistent Organic Pollutants in Apri 2011. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in May 2014.

As a continuous survey, the first survey was in FY2011, under the framework of the Environmental Survey of Chemical Substances up to FY2001, the substance was monitored in surface water and sediment in FY1982 and air in FY1996.

Under the framework of the Environmental Monitoring, the substances have been monitored in surface water and sediment in FY2011 FY2012 FY2018 and FY2021 and wildlife (bivalves, fish and birds) in FY2011 FY2012 FY2014 FY2015 and FY2021, and in air in FY2011 FY2012 FY2014~2016 and FY2021.

No monitoring was conducted in FY2022. For reference, the monitoring results up to FY2021 are given below.

・ Monitoring results until FY2021

<Surface Water>

Stocktaking of the detection of α-Endosulfan and β-Endosulfan in surface water during FY2011~2021

α-Endosulfan	Monitored year	Geometric mean	Median	Maximum	Minimum	Quantification [Detection] limit	Detection Frequency	
							Sample	Site

[19] 1,2,5,6,9,10-Hexabromocyclododecanes

・ History and state of monitoring

1,2,5,6,9,10-Hexabromocyclododecanes have been used a flame retardant additive, providing fire protection during the service life of vehicles, buildings or articles, as well as protection while stored. *α*-1,2,5,6,9,10-Hexabromocyclododecane, *β*-1,2,5,6,9,10-Hexabromocyclododecane and *γ*-1,2,5,6,9,10-Hexabromocyclododecane were adopted as target chemicals at the COP6 of the Stockholm convention on Persistent Organic Pollutants held from late April to early May 2013, and designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in May 2014.

As a continuous survey, the first survey was in FY2011, under the framework of the Environmental Survey of Chemical Substances up to FY2001, the substances were monitored in surface water, sediment and wildlife (fish) in FY1987. In the framework of the Environmental Survey and Monitoring of Chemicals after FY2002 under the Initial Environmental Survey and the Detailed Environmental Survey etc., the substance was monitored in surface water and sediment in FY2003, in wildlife (fish) in FY2004.

Under the framework of the Environmental Monitoring, *α*-1,2,5,6,9,10-Hexabromocyclododecane *β*-1,2,5,6,9,10-Hexabromocyclododecane and *γ*-1,2,5,6,9,10-Hexabromocyclododecane have been monitored in surface water in FY2011 and FY2014, in sediment in FY2011 FY2012 FY2015 FY2016 and FY2022, in wildlife (bivalves, fish and birds) in FY2011 FY2012 FY2014~2019 and FY2022, and in air in FY2012 FY2014~2017 FY2019 and FY2022. Until 2015, *δ*-1,2,5,6,9,10-Hexabromocyclododecane and *ε*-1,2,5,6,9,10-Hexabromocyclododecan had also been monitored.

・ Monitoring results

<Surface Water>

α-1,2,5,6,9,10-Hexabromocyclododecane: The presence of the substance in surface water was monitored at 48 sites, and it was not detected at all 48 valid sites adopting the detection limit of 200pg/L.

β-1,2,5,6,9,10-Hexabromocyclododecane: The presence of the substance in surface water was monitored at 48 sites, and it was not detected at all 48 valid sites adopting the detection limit of 200pg/L.

γ-1,2,5,6,9,10-Hexabromocyclododecane: The presence of the substance in surface water was monitored at 48 sites, and it was not detected at all 48 valid sites adopting the detection limit of 300pg/L.

δ-1,2,5,6,9,10-Hexabromocyclododecane: The presence of the substance in surface water was monitored at 48 sites, and it was not detected at all 48 valid sites adopting the detection limit of 300pg/L.

ε-1,2,5,6,9,10-Hexabromocyclododecane: The presence of the substance in surface water was monitored at 48 sites, and it was not detected at all 48 valid sites adopting the detection limit of 200pg/L.

Stocktaking of the detection of 1,2,5,6,9,10-Hexabromocyclododecanes in surface water in FY2011 FY2014 and FY2022

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2011.

(Note 2) No monitoring was conducted in FY2013 FY2014 and FY2017~2021. No monitoring of δ-1,2,5,6,9,10-Hexabromocyclododecane and ε-1,2,5,6,9,10-Hexabromocyclododecane was conducted in FY2016.

<Wildlife>

α-1,2,5,6,9,10-Hexabromocyclododecane: The presence of the substance in bivalves was monitored in 3 areas, and it was detected at all 3 valid areas adopting the detection limit of 20pg/g-wet, and the detection range was 80 ~ 250pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 14 of the 18 valid areas adopting the detection limit of 20pg/g-wet, and the detection range was up to 450pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at all 2 valid areas adopting the detection limit of 20pg/g-wet, and the detection range was 460 ~ 750pg/g-wet.

As results of the inter-annual trend analysis from FY2011 to FY2022, reduction tendencies in specimens of bivalves and fish were identified as statistically significant.

β-1,2,5,6,9,10-Hexabromocyclododecane: The presence of the substance in bivalves was monitored in 3 areas, and it was not detected at all 3 valid areas adopting the detection limit of 20pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was not detected at all 18 valid areas adopting the detection limit of 20pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was not detected at all 2 valid areas adopting the detection limit of 20pg/g-wet.

As results of the inter-annual trend analysis from FY2011 to FY2022, although the number of detections was small, the detection rates of specimens from bivalves and fish were decreased, it suggested reduction tendencies of the concentrations.

γ-1,2,5,6,9,10-Hexabromocyclododecane: The presence of the substance in bivalves was monitored in 3 areas, and it was detected at 2 of the 3 valid areas adopting the detection limit of 20pg/g-wet, and the detection range was up to tr(30)pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 8 of the 18 valid areas adopting the detection limit of 20pg/g-wet, and the detection range was up to tr(30)pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was not detected at all 2 valid areas adopting the detection limit of 20pg/g-wet.

As results of the inter-annual trend analysis from FY2011 to FY2022, a reduction tendency in specimens of bivalves was identified as statistically significant. And although the number of detections was small, the detection rate of specimens from fish was decreased, it suggested reduction tendencies of the concentrations.

δ-1,2,5,6,9,10-Hexabromocyclododecane: The presence of the substance in bivalves was monitored in 3 areas, and it was not detected at all 3 valid areas adopting the detection limit of 20pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was not detected at all 18 valid areas adopting the detection limit of 20pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was not detected at all 2 valid areas adopting the detection limit of 20pg/g-wet.

ε-1,2,5,6,9,10-Hexabromocyclododecane: The presence of the substance in bivalves was monitored in 3 areas, and it was not detected at all 3 valid areas adopting the detection limit of 20pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was not detected at all 18 valid areas adopting the detection limit of 20pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was not detected at all 2 valid areas adopting the detection limit of 20pg/g-wet.

Stocktaking of the detection of 1,2,5,6,9,10-Hexabromocyclododecanes in wildlife (bivalves, fish and birds) during FY2011~2022

(Note 1) *1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2011.

(Note 2) *2: There is no consistency between the results of the ornithological survey after FY2014 and those in previous years because of the changes in the survey sites and target species.

(Note 3) No monitoring was conducted in FY2013 FY2020 and FY2021. No monitoring of δ-1,2,5,6,9,10-Hexabromocyclododecane and ε-1,2,5,6,9,10-Hexabromocyclododecane was conducted in FY2016~2019.

<Air

α-1,2,5,6,9,10-Hexabromocyclododecane: The presence of the substance in air was monitored at 36 sites, and it was detected at 35 of the 36 valid sites adopting the detection limit of 0.06pg/m^3, and the detection range was up to 19pg/m^3.

As a result of the inter-annual trend analysis from FY2012 to FY2022, a reduction tendency in specimens from warm season was identified as statistically significant.

β-1,2,5,6,9,10-Hexabromocyclododecane: The presence of the substance in air was monitored at 36 sites, and it was detected at 19 of the 36 valid sites adopting the detection limit of 0.07pg/m^3, and the detection range was up to 4.1pg/m^3.

As a result of the inter-annual trend analysis from FY2012 to FY2022, a reduction tendency in specimens from warm season was identified as statistically significant.

γ-1,2,5,6,9,10-Hexabromocyclododecane: The presence of the substance in air was monitored at 36 sites, and it was detected at 32 of the 36 valid sites adopting the detection limit of 0.05pg/m^3, and the detection range was up to 3.1pg/m^3.

As a result of the inter-annual trend analysis from FY2012 to FY2022, a reduction tendency in specimens from warm season was identified as statistically significant.

[20] Total Polychlorinated Naphthalenes (Total PCNs) (references)

・ History and results of the monitoring

Polychlorinated Naphthalenes (PCNs) make effective insulating coatings for electrical wires and have been used as wood preservatives, as rubber and plastic additives, for capacitor dielectrics and in lubricants. The substances with over 3 chloric ions were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in August 1979. And PCNs (Cl_2~Cl_8) was adopted as target chemicals at the COP7 of the Stockholm convention on Persistent Organic Pollutants in May 2015 and Dichloronaphthalene designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2016.

In previous monitoring series, Polychlorinated Naphthalenes were monitored in wildlife (bivalves, fish and birds) during the period of FY1980~1985 FY1987 FY 1989 FY 1991 and FY 1993 under the framework of "the Wildlife Monitoring."

Under the framework of "the Environmental Monitoring", Polychlorinated Naphthalenes with over a chloric ions have been monitored in surface water in FY2008 FY2018 FY2019 and FY2021, in sediment in FY2008 FY2016~2019 and FY2021, in wildlife (bivalves, fish and birds) in FY 2006 FY2008 FY2015~2019 and FY2021, and in air in FY2008 FY2014 FY2016~2019 and FY2021.

No monitoring was conducted in FY2022. For reference, the monitoring results up to FY2021 are given below.

・ Monitoring results until FY2021

[21] Hexachlorobuta-1,3-diene

・ History and results of the monitoring

Hexachlorobuta-1,3-diene had been used as a solvent for other chlorine-containing compounds. The substance was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law on April 2005. The substance was adopted as target chemicals at the COP7 of the Stockholm convention on Persistent Organic Pollutants in May 2015.

As a continuous survey, the first survey was in FY2007, under the framework of the Environmental Survey of Chemical Substances up to FY2002, the substance was monitored in surface wate and sediment in FY1981, under the framework of the Environmental Survey and Monitoring of Chemicals after FY2002, in the Initial Environmental Survey and the Detailed Environmental Survey etc., the substance was monitored in surface water and sediment in FY2007.

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water sediment and wildlife (bivalves, fish and birds) in FY2007 FY2013 and FY2020~2022, and in air in FY2015~2022.

・ Monitoring results

<Surface Water>

The presence of the substance in surface water was monitored at 48 sites, and it was not detected at all 48 valid sites adopting the detection limit of 40pg/L.

Stocktaking of the detection of Hexachlorobuta-1,3-diene in surface water during FY2007~2022

(Note 1) *: Arithmetic mean values were calculated for each point, from which the geometric mean value for all points were derived in FY2007 and FY2013.

(Note 2) No monitoring was conducted during FY2008~2012 and FY2013~2019.

<Wildlife>

The presence of the substance in bivalves was monitored in 3 areas, and it was not detected at all 3 valid areas adopting the detection limit of 4pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 9 of the 18 valid areas adopting the detection limit of 4pg/g-wet, and the detection range was up to

290pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was not detected at all 2 valid areas adopting the detection limit of 4pg/g-wet.

[22] Pentachlorophenol and its salts and esters (reference)

・ History and state of monitoring

Pentachlorophenol was used as a herbicide, insecticide, fungicide, algaecide, disinfectant and as an ingredient in antifouling paint. Pentachlorophenol and its salts and esters were adopted as target chemicals at the COP7 of the Stockholm convention on Persistent Organic Pollutants in May 2015, and designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in Octorber 2016.

As a continuous survey, the first survey of Pentachlorophenol was in FY2015, under the framework of the Environmental Survey of Chemical Substances up to FY2007, the substance was monitored in surface water and sediment in FY1974 and FY1996, and under the framework of the Environmental Survey and Monitoring of Chemicals after FY2002, in the Initial Environmental Survey and the Detailed Environmental Survey etc., the substance was monitored in surface water in FY2005.

Under the framework of the Environmental Monitoring, Pentachlorophenol was monitored in surface water in FY2015. And Pentachlorophenol and Pentachloroanisole have been monitored in surface water and sediment in FY2017~2019, and in wildlife (bivalves, fish and birds) and air in FY2016~2019.

No monitoring was conducted after FY2020. For reference, the monitoring results up to FY2019 are given below.

・ Monitoring results until FY2019

<Surface Water>

Stocktaking of the detection of Pentachlorophenol and Pentachloroanisole in surface water during FY2015~2019

[23] Short-chain chlorinated paraffins

・ History and state of monitoring

Short-chain chlorinated paraffinsare are used primarily in metalworking applications and in polyvinyl chloride (PVC) plastics. Other uses are adhesives and sealants, leather fat liquors, plastics, and as flame retardants in rubber, textiles and polymeric materials. The substances were adopted as target chemicals at the COP8 of the Stockholm convention on Persistent Organic Pollutants in April-May 2017.

Under the framework of the Initial Environmental Survey and the Detailed Environmental Survey etc., the substances were surveied in surface water, sediment and wildlife (fish) in FY2004 and in surface water, sediment and wildlife (bivalves and fish) in FY2005.

Under the framework of the Environmental Monitoring, the substances have been monitored in surface water and sediment in FY2017~2022, and in wildlife (bivalves, fish and birds) and air in FY2016 ~2022.

The results of short-chain chlorinated paraffins are tentative values obtained in trials among various problems in the measurement method.

・ Monitoring results

<Surface water>

Chlorinated decanes: The presence of the substances in surface water was monitored at 48 sites, and it was detected at 47 of the 48 valid sites adopting the detection limit of 100pg/L, and the detection range was up to 1,100pg/L.

Chlorinated undecanes: The presence of the substances in surface water was monitored at 48 sites, and it was detected at 37 of the 48 valid sites adopting the detection limit of 300pg/L, and the detection range was up to 2,200pg/L.

Chlorinated dodecanes: The presence of the substances in surface water was monitored at 48 sites, and it was detected at 17 of the 48 valid sites adopting the detection limit of 300pg/L, and the detection range was up to 2,400pg/L.

Chlorinated tridecanes: The presence of the substances in surface water was monitored at 48 sites, and it was detected at 47 of the 48 valid sites adopting the detection limit of 200pg/L, and the detection range was up to 3,900pg/L.

<Sediment>

Chlorinated decanes: The presence of the substances in sediment was monitored at 61 sites, and it was detected at 48 of the 61 valid sites adopting the detection limit of 70pg/g-dry, and the detection range was up to 6,500pg/g-dry.

Chlorinated undecanes: The presence of the substances in sediment was monitored at 61 sites, and it was detected at 57 of the 61 valid sites adopting the detection limit of 100pg/g-dry, and the detection range was up to 16,000pg/g-dry.

Chlorinated dodecanes: The presence of the substances in sediment was monitored at 61 sites, and it was detected at 53 of the 61 valid sites adopting the detection limit of 200pg/g-dry, and the detection range was up to 19,000pg/g-dry.

Chlorinated tridecanes: The presence of the substances in sediment was monitored at 61 sites, and it was detected at 54 of the 61 valid sites adopting the detection limit of 200pg/g-dry, and the detection range was up to 28,000pg/g-dry.

<Wildlife>

Chlorinated decanes: The presence of the substances in bivalves was monitored in 3 areas, and it was detected at 1 of the 3 valid areas adopting the detection limit of 200pg/g-wet, and the detected concentration was tr(300)pg/g-wet. For fish, The presence of the substances was monitored in 18 areas, and it was detected at 6 of the 18 valid areas adopting the detection limit of 200pg/g-wet, and the detection range was up to tr(400)pg/g-wet. For birds, The presence of the substances was monitored in 2 areas, and it was detected at 1 of the 2 valid areas adopting the detection limit of 200pg/g-wet, and the detected concentration was tr(200)pg/g-wet.

Chlorinated undecanes: The presence of the substances in bivalves was monitored in 3 areas, and it was detected at 1 of the 3 valid areas adopting the detection limit of 300pg/g-wet, and the detected concentration was tr(500)pg/g-wet. For fish, The presence of the substances was monitored in 18 areas, and it was detected at 7 of the 18 valid areas adopting the detection limit of 300pg/g-wet, and the detection range was up to tr(700)pg/g-wet. For birds, The presence of the substances was monitored in 2 areas, and it was not detected at all 2 valid areas adopting the detection limit of 300pg/g-wet.

Chlorinated dodecanes: The presence of the substances in bivalves was monitored in 3 areas, and it was detected at 2 of the 3 valid areas adopting the detection limit of 300pg/g-wet, and the detection range was up to 900pg/g-wet. For fish, The presence of the substances was monitored in 18 areas, and it was detected at 13 of the 18 valid areas adopting the detection limit of 300pg/g-wet, and the detection range was up to tr(800)pg/g-wet. For birds, The presence of the substances was monitored in 2 areas, and it was detected at 1 of the 2 valid areas adopting the detection limit of 300pg/g-wet, and the detected concentration was tr(500)pg/g-wet.

Chlorinated tridecanes: The presence of the substances in bivalves was monitored in 3 areas, and it was detected at 2 of the 3 valid areas adopting the detection limit of 400pg/g-wet, and the detection range was up to 1,000pg/g-wet. For fish, The presence of the substances was monitored in 18 areas, and it was detected at 7 of the 18 valid areas adopting the detection limit of 400pg/g-wet, and the detection range was up to tr(700)pg/g-wet. For birds, The presence of the substances was monitored in 2 areas, and it was detected at 1 of the 2 valid areas adopting the detection limit of 400pg/g-wet, and the detected concentration was 900pg/g-wet.

Stocktaking of the detection of Chlorinated decanes, Chlorinated undecanes, Chlorinated dodecanes and Chlorinated tridecanes in wildlife (bivalves, fish and birds) during FY2016~2022

<Air>

Chlorinated decanes: The presence of the substances in air was monitored at 36 sites, and it was detected at all 36 valid sites adopting the detection limit of 40pg/m^3, and the detection range was tr(40) ~ 490pg/m^3.

Chlorinated undecanes: The presence of the substances in air was monitored at 36 sites, and it was detected at 22 of the 36 valid sites adopting the detection limit of 100pg/m^3, and the detection range was up to 2,400pg/m^3.

Chlorinated dodecanes: The presence of the substances in air was monitored at 36 sites, and it was detected at 11 of the 36 valid sites adopting the detection limit of 120pg/m^3, and the detection range was up to 430pg/m^3.

Chlorinated tridecanes: The presence of the substances in air was monitored at 36 sites, and it was detected at 3 of the 36 valid sites adopting the detection limit of 110pg/m^3, and the detection range was up to tr(190)pg/m^3.

(Note) In FY2016, Chlorinated decanes with 4~6 chlorines and Chlorinated undecanes, Chlorinated dodecanes and Chlorinated tridecanes with 4~7 chlorines are target chemicals. From FY2017 to FY2019, Chlorinated paraffins with 4~7 chlorines are target chemicals. After FY2020, Chlorinated paraffins with 4~8 chlorines are target chemicals.

[24] Dicofol (references)

・ History and state of monitoring

Dicofol was used as insecticides and mites etc., but the registration of Chlordanes under the Agricultural Chemicals Regulation Law was expired in FY2004. The substance was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2005. The substance was adopted as a target chemical at the COP9 of the Stockholm convention on Persistent Organic Pollutants held from late April to early May 2019.

Under the framework of the Initial Environmental Survey and the Detailed Environmental Survey etc., the substance was surveied in sediment in FY2004.

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water and sediment in FY2008 FY2019 and FY2020, in wildlife (bivalves, fish and birds) in FY2006 FY2008 and FY2018~2020, and in air in FY2016 FY2019 and FY2020.

No monitoring was conducted after FY2021. For reference, the monitoring results up to FY2020 are given below.

・ Monitoring results until FY2020

<Surface Water>

Stocktaking of the detection of Dicofol in surface water during FY2008~2020

Dicofol	Monitored year	Geometric mean	Median	Maximum	Minimum	Quantification [Detection] limit	Detection Frequency	
							Sample	Site
Surface Water (pg/L)	2008	nd	nd	76	nd	25 [10]	13/48	13/48
	2019	nd	nd	40	nd	13 [8]	3/48	3/48
	2020	nd	nd	30	nd	13 [5]	1/46	1/46

(Note) No monitoring was conducted in FY2009~2018.

<Sediment>

Stocktaking of the detection of Dicofol in sediment during FY2008~2020

Dicofol	Monitored year	Geometric mean *	Median	Maximum	Minimum	Quantification [Detection] limit	Detection Frequency	
							Sample	Site
Sediment (pg/g-dry)	2008	nd	nd	460	nd	160 [63]	13/63	30/186
	2019	4	4	84	nd	4 [2]	40/61	40/61
	2020	tr(5)	nd	77	nd	13 [5]	23/58	23/58

(Note 1) *: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2008.

(Note 2) No monitoring was conducted in FY2009~2018.

<Wildlife>

Stocktaking of the detection of Dicofol in wildlife (bivalves, fish and birds) during FY2006~2020

	2019 Warm season	nd	nd	0.4	nd	0.4 [0.2]	5/36	5/36
	2020 Warm season	nd	nd	tr(0.3)	nd	0.5 [0.2]	3/37	3/37

(Note) No monitoring was conducted in FY2017 and FY2018.

[25] Perfluorohexane sulfonic acid (PFHxS)

・ History and state of monitoring

Perfluorohexane sulfonic acid (PFHxS) is used as Fluoropolymer processing aid and Surfactant etc. Perfluorohexane sulfonic acid (PFHxS), its salts and PFHxS-related compounds were adopted as target chemicals at the COP10 of the Stockholm convention on Persistent Organic Pollutants in June 2022.

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water and sediment in FY2018~FY2022, and in wildlife (bivalves, fish and birds) and air in FY2020~2022.

・ Monitoring results

<Surface Water>

The presence of the substance in surface water was monitored at 48 sites, and it was detected at 42 of the 48 valid sites adopting the detection limit of 30pg/L, and the detection range was up to 1,800pg/L.

Stocktaking of the detection of Perfluorohexane sulfonic acid (PFHxS) in surface water during FY2018~2022

Perfluorohexane sulfonic acid (PFHxS)	Monitored year	Geometric mean	Median	Maximum	Minimum	Quantification [Detection] Limit	Detection Frequency	
							Sample	Site
Surface water (pg/L)	2018	190	130	2,600	nd	120 [50]	44/47	44/47
	2019	150	120	1,800	nd	60 [30]	45/48	45/48
	2020	160	120	1,500	nd	60 [20]	44/46	44/46
	2021	160	110	2,300	nd	70 [30]	44/47	44/47
	2022	130	120	1,800	nd	70 [30]	42/48	42/48

<Sediment>

The presence of the substance in sediment was monitored at 61 sites, and it was detected at 28 of the 61 valid sites adopting the detection limit of 3pg/g-dry, and the detection range was up to 16pg/g-dry.

Stocktaking of the detection of Perfluorohexane sulfonic acid (PFHxS) in sediment during FY2018~2022

Perfluorohexane sulfonic acid (PFHxS)	Monitored year	Geometric mean	Median	Maximum	Minimum	Quantification [Detection] Limit	Detection Frequency	
							Sample	Site
Sediment (pg/g-dry)	2018	nd	nd	27	nd	11 [5]	15/61	15/61
	2019	nd	nd	15	nd	13 [5]	10/61	10/61

	2021	nd	nd	15	nd	6 [3]	19/60	19/60
	2022	tr(3)	nd	16	nd	6 [3]	28/61	28/61

<Wildlife>

The presence of the substance in bivalves was monitored in 3 areas, and it was not detected at all 3 valid areas adopting the detection limit of 3pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 10 of the 18 valid areas adopting the detection limit of 3pg/g-wet, and the detection range was up to 20pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at all 2 valid areas adopting the detection limit of 3pg/g-wet, and the detection range was 250 ~ 630pg/g-wet.

Stocktaking of the detection of Perfluorohexane sulfonic acid (PFHxS) in wildlife (bivalves, fish and birds) in FY2020~2022

Perfluorohexane sulfonic acid (PFHxS)	Monitored year	Geometric mean	Median	Maximum	Minimum	Quantification [Detection] Limit	Detection Frequency	
							Sample	Site
Bivalves (pg/g-wet)	2020	tr(2)	tr(3)	tr(3)	nd	5 [2]	2/3	2/3

Reference: Egg of Great Cormorants (egg yolk and white)

In the FY2022 monitoring survey, eggs of great cormorants were analyzed to check for the presence of 11 chemicals (groups): PCBs, Hexachlorobenzene, HCHs, Polybromodiphenyl ethers(Br_4~Br_{10}), Perfluorooctane sulfonic acid (PFOS), Perfluorooctanoic acids (PFOA), Pentachlorobenzene, 1,2,5,6,9,10-Hexabromocyclododecanes, Hexachlorobuta-1,3-diene, Short-chain chlorinated paraffins and Perfluorohexane sulfonic acid (PFHxS).

The eggs were taken around Koyaike pond*. The results of the analysis in Table 1.

(Note) *: The eggs were taken by Water and Air Division, Environment Department, Hyogo Prefectural Government and Green and Nature Section, Urban Transportation Department, Itami City.
