# Chapter 3 Results of the Environmental Monitoring in FY2023

### 1. Purpose of the monitoring

Environmental Monitoring provides annual surveys of the environmental persistence of target chemicals as listed in the Stockholm Convention, chemicals that while undesignated are still subject to review for potential risk, and/or highly persistent chemicals annotated as Specified Chemical Substances and Monitored Chemical Substances under the Law Concerning the Examination and Regulation of Manufacture, etc. of Chemical Substances (aka, the Chemical Substances Control Law), all target chemicals whose year to year changes in persistence in the environment must be understood.

\*POPs: persistent organic pollutants

### 2. Target chemicals

In the FY2023 Environmental Monitoring, 11 chemicals (groups) were designated as target chemical.

2 of the target chemicals (groups) were Polychlorinated biphenyls (PCBs) and Hexachlorobenzene, which were listed as Persistent Organic Pollutants (POPs) initially in the Stockholm Convention in 2004<sup>1</sup>. 2 of them were Perfluorooctane sulfonic acid (PFOS)<sup>2</sup> and Pentachlorobenzene, which were adopted to be the POPs at fourth meeting of the Conference of the Parties (COP) held 2009. 1 of them was Hexachlorobuta-1,3-diene, which were adopted to be the POPs at seventh meeting of COP held 2015. 1 of them was Short-chain chlorinated paraffins<sup>3</sup>, which was adopted to be the POPs at eighth meeting of COP held 2017. 1 was Perfluorooctanoic acid (PFOA)<sup>4</sup>, which was adopted to be the POPs at ninth meeting of COP held 2019. 1 was Perfluorohexane sulfonic acid (PFHxS)<sup>5</sup>, which was adopted to be the POPs at tenth meeting of COP held 2021 and 2022. Other were Methoxychlor, Dechlorane pluses and UV-328, which were adopted to be the POPs at eleventh meeting of COP held 2023.

The combinations of target chemicals and the monitoring media are given below.

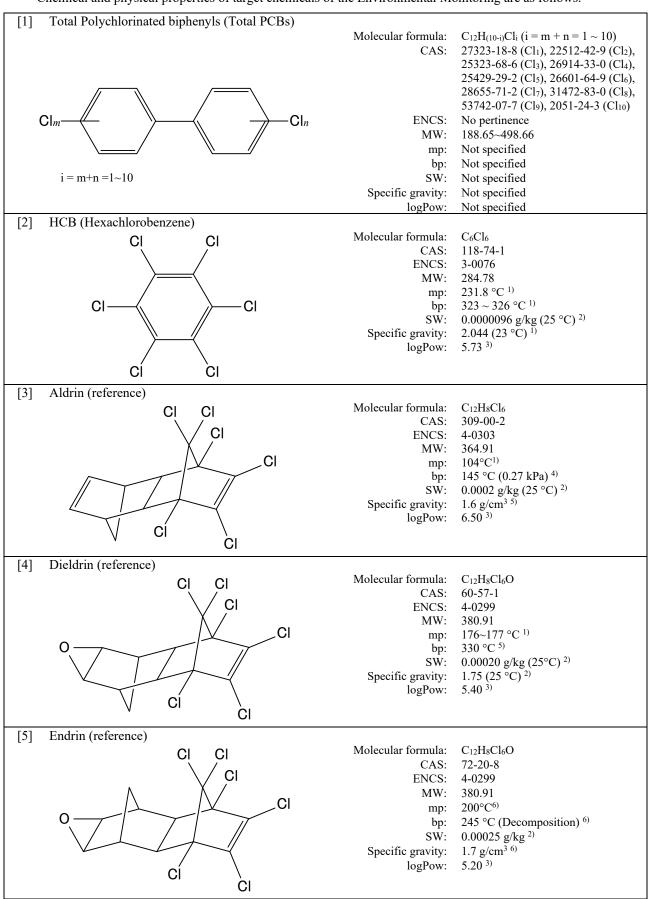

- (Note 1) Up to FY2009, the 11 target chemicals (groups) were monitored each fiscal year. 10 out of the 11 target chemicals (groups) were exceptions of Polychlorinated dibenzo-p-dioxin (PCDDs) and Polychlorinated dibenzofurans (PCDFs) from 12 chemicals (groups) listed as the POPs initially in the Stockholm Convention. Another was HCHs (Hexachlorohexanes) <sup>6</sup>. As of FY2010, chemicals (groups) adopted or considerd to be the POPs in the convention have been monitored too, and adjustments made to implementation frequency. In FY2023, 11 chemicals (groups) that have been designated as target chemicals (groups) in this Environmental Monitoring were not moniterd. They were Aldrin, Dieldrin, Endrin, DDTs<sup>7</sup>, Chlordanes<sup>8</sup>, Heptachlors<sup>9</sup>, Toxaphenes<sup>10</sup>, Mirex, Chlordecone, HCHs (Hexachlorohexanes), Hexabromobiphenyls, Polybromodiphenyl ethers (Br<sub>4</sub>~Br<sub>10</sub>)<sup>11</sup>, Endosulfans, 1,2,5,6,9,10-Hexabromocyclododecanes<sup>12</sup>, Polychlorinated Naphthalenes<sup>13</sup> Pentachlorophenol and its salts and esters<sup>14</sup> and Dicofol. Up to the latest results of the 17 chemicals (groups) have been included in this report for purpose of reference.
- (Note 2) Perfluorooctane sulfonic acid (PFOS), its salts and Perfluorooctane sulfonyl fluoride were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants. The survey of the Perfluorooctane sulfonic acid (PFOS) only monitored linear octyl Perfluorooctane sulfonic acid (PFOS).
- (Note 3) Chlorinated paraffins ( $C_{10}\sim C_{13}$ ) was adopted as target chemicals at the COP8 of the Stockholm convention on Persistent Organic Pollutants. In the survey, Chlorinated paraffins with 5~9 chlorines are target chemicals in surface water, sediment and wildlife, and Chlorinated paraffins with 4~7 chlorines are target chemicals in air.
- (Note 4) Perfluorooctanoic acid (PFOA), its salts and PFOA-related compounds were adopted as target chemicals at the COP9 of the Stockholm convention on Persistent Organic Pollutants. The survey of the Perfluorooctanoic acid

- (PFOA) only monitored linear octyl Perfluorooctanoic acid (PFOA).
- (Note 5) Perfluorohexane sulfonic acid (PFHxS), its salts and PFHxS-related compounds were adopted as target chemicals at the COP9 of the Stockholm convention on Persistent Organic Pollutants. The survey of the Perfluorohexane sulfonic acid (PFHxS) only monitored linear hexyl Perfluorohexane sulfonic acid (PFHxS).
- (Note 6) In the COP4,  $\alpha$ -HCH,  $\beta$ -HCH and  $\gamma$ -HCH (synonym: Lindane) were adopted to be POPs among HCHs, but in this Environmental Monitoring, HCHs which were able to include  $\delta$ -HCH were designated as target chemicals.
- (Note 7) p,p'-DDT and o,p'-DDT were adopted as target chemicals of the Stockholm convention on Persistent Organic Pollutants. In the survey, DDTs including environmental degraded products p,p'-DDT, o,p'-DDT, p,p'-DDD and o,p'-DDD were target chemicals.
- (Note 8) *cis*-Chlordane and *trans*-Chlordane were adopted as target chemical of the Stockholm convention on Persistent Organic Pollutants. In the survey, Chlordanes including *cis*-Chlordane, *trans*-Chlordane Oxychlordane, *cis*-Nonachlor and *trans*-Nonachlor are target chemicals.
- (Note 9) Heptachlor was adopted as target chemical of the Stockholm convention on Persistent Organic Pollutants. In the survey, Heptachlors including *cis*-Heptachlor epoxide and *trans*-Heptachlor epoxide are target chemicals.
- (Note 10) Chlorobornane and Chlorocamphene of industrial blended material (about 16,000 congeners or isomer) were adopted as target chemicals of the Stockholm convention on Persistent Organic Pollutants. In the survey, 2-endo,3-exo,5-endo,6-exo,8,8,10,10-octachlorobornane (Parlar-26), 2-endo,3-exo,5-endo,6-exo,8,8,9,10,10-nonachlorobornane (Parlar-50) and 2,2,5,5,8,9,9,10,10-Nonachlorobornane (Parlar-62) are target chemicals.
- (Note 11) Tetrabromodiphenyl ethers, Pentabromodiphenyl ethers, Hexabromodiphenyl ethers, and Heptabromodiphenyl ethers were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants. Decabromodiphenyl ether was adopted as target chemicals at the COP8 of the Stockholm convention on Persistent Organic Pollutants. In the survey, Polybromodiphenyl ethers including those from 4 to 10 bromines are target chemicals.
- (Note 12)  $\alpha$ -1,2,5,6,9,10-Hexabromocyclododecane,  $\beta$ -1,2,5,6,9,10-Hexabromocyclododecane and  $\gamma$ -1,2,5,6,9,10-Hexabromocyclododecane were adopted as target chemicals at the COP6 of the Stockholm convention on Persistent Organic Pollutants. In the survey, 1,2,5,6,9,10-Hexabromocyclododecanes including  $\delta$ -1,2,5,6,9,10-Hexabromocyclododecane are target chemicals.
- (Note 13) PCNs (Cl<sub>2</sub>~Cl<sub>8</sub>) was adopted as target chemicals at the COP7 of the Stockholm convention on Persistent Organic Pollutants. In the survey, PCNs including those with one (1) chlorine are target chemicals.
- (Note 14) Pentachlorophenol and its salts and esters were adopted as target chemicals at the COP7 of the Stockholm convention on Persistent Organic Pollutants, the survey monitored Pentachlorophenol and Pentachloroanisole.

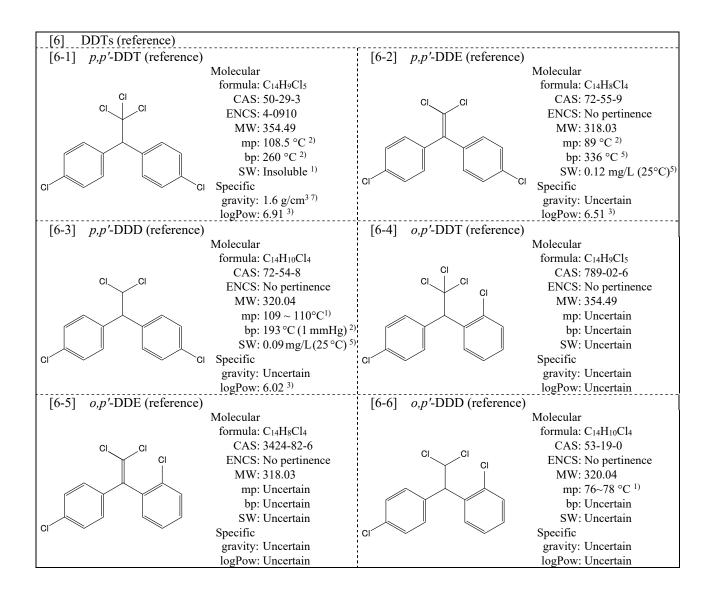

Total Polychlorinated biphenyls (Total PCBs)   Total PCBs represents the sum of the PCB congeners listed in the table below. "Total PCBs" only indicates the total amount in the following pages, and the measured values of the individual congeners and coplanar PCBs are listed on the website.		ed media	Monitore

(Note 1) \*1: Organisations responsible for sampling are described by their official names in FY2023

(Note 2) \*2: Because there were the examples of survey that obtained the eggs in other countries, the eggs of great cormorants were taken in this survey by Water and Air Division, Environment Department, Hyogo Prefectural Government and Green and Nature Section, Urban Transportation Department, Itami City. The results were treated as the reference values.

### (2) Monitored sites (areas)

In the Environmental Monitoring (of surface water, sediment, wildlife, and air), the sampling of specimens was entrusted to prefectural governments and government-designated cities across Japan and the specimens sampled were analysed by private analytical laboratories.

The monitored sites (areas) are shown in Table 3-1-1 and Figure 3-1-1 for surface water, Table 3-1-2 and Figure 3-1-2 for sediment, Table 3-1-3 and Figure 3-1-3 for wildlife and Table 3-1-4 and Figure 3-1-4 for air. The breakdown is summarized as follows.

Monitored	Numbers of local	Numbers of target	Numbers of monitored	Numbers of samples at a
media	communities	chemicals (groups)	sites (or areas)	monitored site (or area)
Surface water	42	11	47	1
Sediment	46	11	60	1*1
Wildlife (bivalves)	2	11	2	1*2
Wildlife (fish)	17	11	18	1* <sup>2</sup>
Wildlife (birds)	3*3	11	3*3	1*2
Air (warm season)	33	11	36	1 or 3*4
All media	56	11	120*3	

(Note 1) \*1: For sediment, at each monitoring point, three (3) specimen samples were collected. The target substances were analysed for each place with one (1) specimen sample that is a mixture of equal parts of the three (3) specimen samples.

### (3) Sampling method of specimens

The sampling of specimens and the preparation of samples were carried out following the "Guidelines on Conducting of Environmental Surveys and Monitoring of Chemicals" (published on March 2021) by the Environment Health and Safety Division, Environmental Health Department, Ministry of the Environment of Japan (MOE).

### (4) Target species

The species to be monitored among the wildlife media were selected considering the possibility of international comparison, as well as their significance and practicality as indicators: 1 bivalve (blue mussel), 9 fishes (predominantly sea bass), and 1 bird (Great Cormorant), namely, 11 species in total.

The properties of the species determined as targets in the FY2023 monitoring are shown in Table 3-2. Moreover, Table 3-1-3 summarizes the outline of the samples used for analysis.

<sup>(</sup>Note 2) \*2: For wildlife species, at each monitoring point, three (3) specimen samples were collected. The target substances were analysed for each place with one (1) specimen sample that is a mixture of equal parts of the three (3) specimen samples.

<sup>(</sup>Note 3) \*3: Samples obtained in 1 site of the birds as wildlife eggs of Great Cormorant, and the sample was measured each the egg yolk and the egg white, the results were treated as a reference values.

<sup>(</sup>Note 4) \*4: The target substances other than [21] Hexachlorobuta-1,3-diene were analysed with one (1) sample for each sit. The target substance [21] Hexachlorobuta-1,3-diene was analysed with the three (3) specimen samples for each site.

Oita Pref.	Mouth of Riv. Oita (Oita City)	February 5, 2024	Fish	Spanish mackerel (Scomberomorus niphonius)
Kagoshima Pref.	West Coast of Satsuma Peninsula	November 24, 2023	Fish	Sea bass (Lateolabrax japonicas)
Okinawa Pref.	Nakagusuku Bay	January 23, 2024	Fish	Okinawa seabeam (Acanthopagrus sivicolus)

Figure 3-1-3 Monitored areas (wildlife) in the Environmental Monitoring in FY2023

Local	Monitored sites	Sampling dates
communities		(Warm season)
Hokkaido	Kushiro General Subprefectural Bureau (Kushiro City)	November $7 \sim 14**$ or November $7 \sim 10$ 2023
Sapporo City	Sapporo Art Park (Sapporo City)	Octorber 24 ~ 27, 2023
Iwate Pref.	Sugo Air Quality Monitoring Station (Takizawa City)	Octorber 23 ~ 26, 2023
Miyagi Pref.	Miyagi Prefectural Institute of Public Health and Environment (Sendai City)	November $27 \sim \text{December } 4^{**} \text{ or November } 27 \sim 30^{*}, 2023$
Yamagata Pref.	Yamagata Institute of Environmental Sciences (Murayama City)	November $6 \sim 13**$ or November $6 \sim 9*$ , 202
Ibaraki Pref.	Ibaraki Kasumigaura Environmental Science Center (Tsuchiura City)	November $7 \sim 14**$ or November $7 \sim 10$ 2023
Tokyo Met.	Tokyo Metropolitan Research Institute for Environmental Protection (Koto Ward)	November $6 \sim 13**$ or November $6 \sim 9*$ , 202
	Chichijima Island (Ogasawara Village)	November $8 \sim 15**$ or November $11 \sim 14$ 2023
Kanagawa Pref.	Kanagawa Environmental Research Center (Hiratsuka City)	Octorber 23 ~ 26, 2023
Yokohama City	Yokohama Environmental Science Research Institute (Yokohama City)	November 13 ~ 20** or November 13 ~ 16 2023
Niigata Pref.	Oyama Air Quality Monitoring Station (Niigata City)	Octorber 30 ~ November 2, 2023
Toyama Pref.	Tonami Air Quality Monitoring Station (Tonami City)	Octorber 23 ~ 26, 2023
Ishikawa Pref.	Ishikawa Prefectural Institute of Public Health and Environmental Science (Kanazawa City)	Octorber 23 ~ 26, 2023
Yamanashi Pref.	Yamanashi Prefectural Institute of Public Health and Environment (Kofu City)	Octorber 23 ~ 26, 2023
Nagano Pref.	Nagano Environmental Conservation Research Institute (Nagano City)	November $6 \sim 13**$ or November $6 \sim 9*$ , 20
Gifu Pref.	Gifu Prefectural Research Institute for Health and Environmental Sciences (Kakamigahara City)	November 27 ~ 30, 2023
Nagoya City	Chikusa Ward Heiwa Park (Nagoya City)	November $7 \sim 14**$ or November $7 \sim 10$ 2023
Mie Pref.	Mie Prefecture Health and Environment Research Institute (Yokkaichi City)	November 13 ~ 16, 2023
Kyoto Prif.	Kyoto Prefecture Joyo Senior High School (Joyo City)	November 13 ~ 16, 2023
Osaka Pref.	Osaka Joint Prefectural Government Building, Building 2 Annex (Osaka City)	November 13 ~ 16, 2023
Hyogo Pref.	Hyogo Prefectural Environmental Research Center (Kobe City)	Octorber 30 ~ November 2, 2023
Kobe City	Kobe City Institute of Health and Environmental Sciences (Kobe City)	November 14 ~ 17, 2023
Nara Pref.	Tenri Air Quality Monitoring Station (Tenri City)	November 27 ~ 30, 2023
Shimane Pref.	Oki National Acid Rain Observatory (Okinoshima Town)	Octorber $17 \sim 20, 2023$
Hiroshima City	Hiroshima City Kokutaiji Junior High School (Hiroshima City)	Octorber 23 ~ 26, 2023
Yamaguchi Pref.	Yamaguchi Prefectural Institute of Public Health and Environment (Yamaguchi City)	Octorber $17 \sim 24**$ or Octorber $17 \sim 20*$ , $20$
	Hagi Health and Welfare Center (Hagi City)	Octorber $17 \sim 24**$ or Octorber $17 \sim 20*$ , $20$
Tokushima Pref.	Tokushima Prefectural Public Health, Pharmaceutical and Environmental Sciences Center (Tokushima City)	November 27 ~ 30, 2023
Kagawa Pref.	Kagawa Prefectural Research Institute for Environmental Sciences and Public Health (Takamatsu City)	November $6 \sim 13**$ or November $6 \sim 9*$ , 20
Ehime Pref.	Ehime Prefectural Government Nanyo Regional Office (Uwajima City)	Octorber 30 ~ November 2, 2023
Saga Pref.	Saga Prefectural Environmental Research Center (Saga City)	Octorber 30 ~ November 6** or Octorber 30 November 2*, 2023
Kumamoto Pref.	Kumamoto Prefectural Institute of Public Health and Environmental Science (Udo City)	Octorber 23 ~ 26, 2023
Miyazaki Pref.	Miyazaki Prefectural Institute for Public Healthand Environment (Miyazaki City)	November $7 \sim 14**$ or November $7 \sim 10^{\circ}$ 2023
Kagoshima Pref.	Kagoshima Prefectural Institute for Environmental Research and Public Health (Kagoshima City)	Octorber 30 ~ November 2, 2023
Okinawa Pref.	Cape Hedo (Kunigami Village)	Octorber 30 ~ November 2, 2023

(Note) " \* " means sampling except [21] Hexachlorobuta-1,3-diene. " \*\* " means sampling [21] Hexachlorobuta-1,3-diene.

Figure 3-1-4 Monitored sites (air) in the Environmental Monitoring in FY2023

Table 3-2 Properties of target species

	Species	Properties	Monitored areas	Aim of monitoring	Notes
Bibalves	Blue mussel (Mytilus galloprovincialis)	Distributed worldwide, excluding tropical zones Adheres to rocks in inner bays and to bridge piers	Yamada bay     Coast of Noto Peninsula	Follow-up of the environmental fate and persistency in specific areas	Monitored in the 2 areas with different levels of persistency
	Greenling (Hexagrammos otakki)	Distributed from Hokkaido to southern Japan, the Korean Peninsula, and China Lives in shallow seas of 5-50 m depth from sea level	Yamada bay     Sendai Bay	Follow-up of the environmental fate and persistency in specific areas	
	Chum salmon (Oncorhynchus keta)	Distributed in northern Pacific Ocean, Sea of Japan, Bering Sea, Sea of Okhotsk, the whole of the Gulf of Alaska, and part of the Arctic Ocean Runs the Tone River on the Pacific Ocean side and rivers in Yamaguchi Prefecture and northward on the Sea of Japan side in Japan Bioaccumulation of chemicals is said to be moderate	Offshore of Kushiro	Follow-up of the environmental fate and persistency on a global scale	
	Dace (Tribolodon hakonensis)	Distributed widely in freshwater environments throughout Japan Preys mainly on insects	• Lake Biwa, Riv. Ado (Takashima City)	Follow-up of the environmental fate and persistency in specific areas	
	Spanish mackerel (Scomberomorus niphonius)	Distributed in subtropical and temperate zones of East Asia Lives in coastal surface layer from spring to autumn and in deeper water in winter	Mouth of Riv. Oita (Oita City)		
Fish	Rock greenling (Hexagrammos lagocephalus)	Lives in cold-current areas of Hidaka and eastward (Hokkaido) Larger than the greenling and eats fish smaller than its mouth size at the sea bottom	Offshore of Kushiro	Follow-up of the environmental fate and persistency in specific areas	
	Sea bass (Lateolabrax japonicus)	Distributed around the shores of various areas in Japan, the Korean Peninsula, and the coastal areas of China Sometimes lives in a freshwater environment and brackish-water regions during its life cycle Bioaccumulation of chemicals is said to be high	<ul> <li>Tokyo Bay</li> <li>Offshore of Ogishima Island, Port of Kawasaki</li> <li>Osaka Bay</li> <li>Offshore of Himeji</li> <li>Nakaumi</li> <li>Hiroshima Bay</li> <li>Mouth of Riv. Shimanto</li> <li>West Coast of Satsuma Peninsula</li> </ul>	Follow-up of the environmental fate and persistency in specific areas	Monitored in the 8 areas with different levels of persistency
	Striped mullet (Mugil cephalus)	Distributed widely in the worldwide tropical zones and subtropical zones Sometimes lives in a freshwater environment and brackish-water regions during its life cycle	Nagoya Port     Offshore of Joban	Follow-up of the environmental fate and persistency in specific areas	
	Chub mackerel (Scomber japonicus)	Ddistributed widely in subtropical zones and temperate zones around the world. Seasonal migration occurs with a northward migration in spring and a southward migration in autumn.	Offshore of Joban	Follow-up of the environmental fate and persistency in specific areas	
	Okinawa seabeam (Acanthopagrus sivicolus)	Distributed around Nansei Shoto (Ryukyu Islands) Lives in coral reefs and in bays into which rivers flow	Nakagusuku Bay	Follow-up of the environmental fate and persistency in specific areas	
Birds	Great Cormorant (immature)* (Phalacrocorax carbo)	Distributed widely throughout Japan Eats primarily fish Bioaccumulation of chemicals is said to be high	Tikubushima Island,     Lake Biwa     Riv.Tenjin (Kurayoshi City)	Follow-up of the concentrations of chemicals in top predators	

<sup>\*</sup> Because there were the examples of survey that obtained the eggs in other countries, the eggs of great cormorants were taken at ather area in this survey. The results were treated as the reference values.

Table 3-3-1 Basic data of specimens (bivalves as wildlife) in the Environmental Monitoring in FY 2023

		1	(		9 : -

(Phalacrocorax carbo)	2		Male	1	108	2,080		
Riv.Tenjin (Kurayoshi City)								

<sup>(</sup>Note 1) The great cormorants (immature) killed as harmful birds were used as specimens.

<sup>(</sup>Note 2) For Great Cormorant, at Riv.Tenjin (Kurayoshi City), two (2) specimen samples were collected. The target substances were analysed for each place with one (1) specimen sample that is a mixture of equal parts of the two (2) specimen samples.

### 4. Method for regression analysis and testing

The analysis procedure and the evaluation for the analysis result shown in Fig.2 were carried out by the following method.

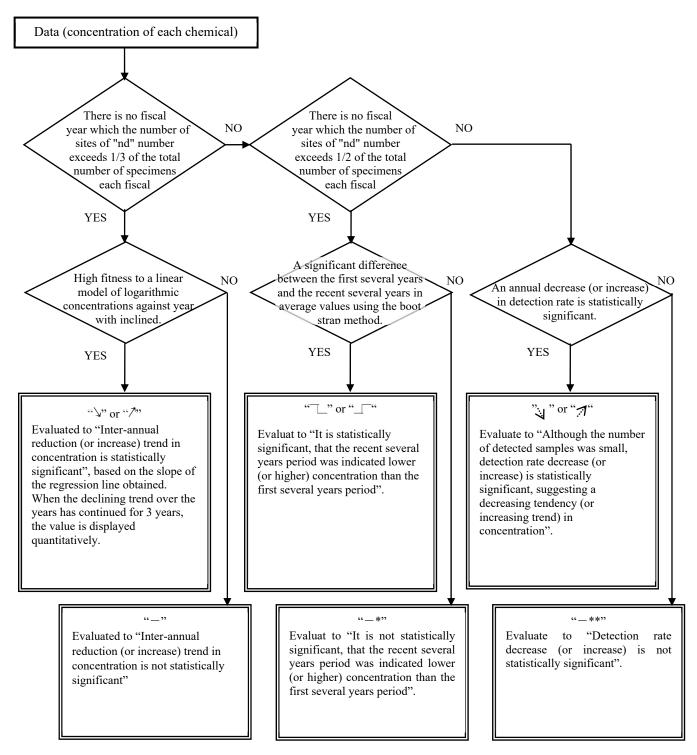

Figure 2 Method for regression analysis and testing

# 5. Summary of monitoring results

The detection ranges are shown in Table 3-4, and the detection limits are shown in Table 3-5.

The substances which were moniterd FY2023 and past years on the same media, were statistically analysed in order to detect inter-annual trends of increase or decrease. The results of the analyses are shown in Table 3-6

OData were carefully handled on the basis of following points.

### · For sediment

At each monitoring point, three (3) specimen samples were collected. And the substances were analysed for each place with one specimen sample that is a mixture of equal parts of the three (3) specimen samples.

### · For wildlife

At each monitoring point, three (3) specimen samples were collected in principle. And the substances were analysed for each place with one specimen sample that is a mixture of equal parts of the three (3) specimen samples.

### • For air

At each monitored site, the sampling was for the monitoring in the warm season (October  $17 \sim$  December 4, 2023).

(Note) There are monitored sites which were classified in the area unlike these names by the situations.

In the wake of the monitoring surveys of FY2002  $\sim$  2023, high-sensitivity analysis of PCBs, and HCB were conducted. All these chemicals were detected in all media.

High-sensitivity analysis of Perfluorooctane sulfonic acid (PFOS) Perfluorooctanoic acid (PFOA) and Perfluorohexane sulfonic acid (PFHxS) in all media, Pentachlorobenzene and Short-chain chlorinated paraffins in wildlife (bivalves fish and birs) and air, Hexachlorobuta-1,3-diene in air, and Methoxychlor Dechlorane pluses and UV-328 in surface water and sediment were also conducted in FY2023.

Except for cases of undetected Chlorinated undecanes in wildlife (bivalves and fish), Perfluorohexane sulfonic acid (PFHxS) in wildlife (bivalves) and Methoxychlor in surface water and sediment, all other chemicals were detected.

The monitoring results for each chemical (group) are described below.

## [1] Total PCBs

#### · History and state of monitoring

Polychlorinated biphenyls (PCBs) were used in industry as heat exchange fluids, etc. and were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in June 1974, since the substances are persistent, highly accumulative in living organisms, and chronically toxic. Also the substances are one of the original twelve POPs covered by the Stockholm Convention.

In previous monitoring series, the substances were monitored in wildlife (bivalves, fish and birds) during the period of FY1978  $\sim$  2001 under the framework of "the Wildlife Monitoring." Under the framework of "The Follow-up Survey of the Status of Pollution by Unintentionally Formed Chemicals," sediment and wildlife (fish) were the monitored media in FY1996 and FY1997, and surface water, sediment, wildlife (fish) and air were the monitored media in FY2000 and FY2001.

Under the framework of the Environmental Monitoring, the substances in surface water sediment wildlife (bivalves, fish and birds) and air have been monitored since FY2002.

#### Monitoring results

#### <Surface Water>

The presence of the substance in surface water was monitored at 47 sites, and it was detected at all 47 valid sites adopting the detection limit of 4 pg/L, and the detection range was  $10 \sim 4,500$  pg/L.

As results of the inter-annual trend analysis from FY2002 to FY2023, reduction tendencies in specimens from river areas, lake areas and river mouth areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

Stocktaking of the detection of Total PCBs (total amount) in surface water during FY2002 ~ 2023

Total PCBs	Monitored	Geometric				Quantification	Detection l	Frequency
(total amount)	year	mean*1	Median	Maximum	Minimum	[Detection]	Sample	Site

(Note 1) \*1 : Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2002 ~ 2009.

(Note 2) 2: The sum value of the Quantification [Detection] limits of each congener

## <Wildlife>

The presence of the substance in bivalves was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 5 pg/g-wet, and the detected concentrations were 240 pg/g-wet and 1,900 pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at all 18 valid areas adopting the detection limit of 5 pg/g-wet, and the detection range was 720 ~ 83,000 pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 5 pg/g-wet, and the detected concentrations were 63,000 pg/g-wet and 380,000 pg/g-wet.

As results of the inter-annual trend analysis from FY2002 to FY2023, reduction tendencies in specimens from bivalves and fish were identified as statistically significant.

- (Note 1) \*1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2002  $\sim$  2009.
- (Note 2) \*2: The sum value of the Quantification [Detection] limits of each congener
- (Note 3) \*3: There is no consistency between the results of the ornithological survey after FY2013 and those in previous years because of the changes in the survey sites and target species.

## <Air>

The presence of the substance in air was monitored at 35 sites, and it was detected at all 35 valid sites adopting the detection limit of  $0.8 \text{ pg/m}^3$ , and the detection range was  $24 \sim 190 \text{ pg/m}^3$ .

As a result of the inter-annual trend analysis from FY2003 to FY2023, a reduction tendency in specimens was identified as statistically significant.

(Note 1) \*1: The sum value of the Quantification [Detection] limits of each congener

(Note 2) \*2: In 2002, there was a technical problem in the measuring method for lowly chlorinated congeners, and therefore the values are shown just as reference.

## [2] Hexachlorobenzene

#### · History and state of monitoring

Hexachlorobenzene was used as pesticidal material and was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in August 1979. Also the substance is one of the original twelve POPs covered by the Stockholm Convention.

In previous monitoring series, the substance was monitored in wildlife (bivalves, fish and birds) during the period of FY1978  $\sim$  1996 and in FY1998, FY2000 and FY2001 under the framework of "the Wildlife Monitoring." Under the framework of "the Surface Water/Sediment Monitoring," the substance in surface water and sediment was monitored during the period of FY1986  $\sim$  1998 and FY1986  $\sim$  2001, respectively.

Under the framework of the Environmental Monitoring, the substance in surface water sediment wildlife (bivalves, fish and birds) and air has been monitored since FY2002.

## · Monitoring results

## <Surface Water>

The presence of the substance in surface water was monitored at 47 sites, and it was detected at all 47 valid sites adopting the detection limit of 0.3 pg/L, and the detection range was  $1.4 \sim 190$  pg/L.

As results of the inter-annual trend analysis from FY2002 to FY2023, reduction tendencies in specimens from river areas, lake areas and river mouth areas were identified as statistically significant. The recent 7 years period was indicated lower concentration than the first 7 years period in specimens from sea areas as statistically significant. And a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant

	2023	6.1	5.3	190	1.4	0.8 [0.3]	47/47	47/47

(Note) \*: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2002.

#### <Sediment>

The presence of the substance in sediment was monitored at 60 sites, and it was detected at all 60 valid sites adopting the detection limit of 0.4 pg/g-dry, and the detection range was  $2.4 \sim 5,200 \text{ pg/g-dry}$ .

As results of the inter-annual trend analysis from FY2002 to FY2023, reduction tendencies in specimens from river areas, river mouth areas and sea areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in sediment was also identified as statistically significant.

(Note) \*: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002 ~ 2009.

## <Wildlife>

The presence of the substance in bivalves was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 0.8 pg/g-wet, and the detected concentrations were 9.3 pg/g-wet and 21 pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at all 18 valid areas adopting the detection limit of 0.8 pg/g-wet, and the detection range was  $21 \sim 560 \text{ pg/g-wet}$ . For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 0.8 pg/g-wet, and the detected concentrations were 2,100 pg/g-wet and 4,200 pg/g-wet.

## [3] Aldrin (references)

#### · History and state of monitoring

Aldrin had been used as a soil insecticide until FY1971 when the application of the substance was substantially stopped. Its registration under the Agricultural Chemicals Regulation Law was expired in FY1975. It was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in October 1981. Also the substance is the initial POPs under the Stockholm Convention since 2004.

In previous monitoring series until FY2001, the substance was monitored in wildlife (bivalves, fish and birds) during the period of FY1978 ~ 1989, FY1991 and FY1993 under the framework of "the Wildlife Monitoring."

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water sediment wildlife (bivalves, fish and birds) and air in FY2002  $\sim$  2009, in wildlife (bivalves, fish and birds) and air in FY2014, and in sediment in FY2018.

No monitoring was conducted after FY2019. For reference, the monitoring results up to FY2018 are given below.

## · Monitoring results until FY2018

(Note) No monitoring was conducted during FY2010 ~ 2013.

<sup>(</sup>Note 2) \*2: There is no consistency between the results of the ornithological survey in FY2014 and those in previous years because of the changes in the survey sites and target species.

## [4] Dieldrin (references)

#### · History and state of monitoring

Dieldrin was used as a pesticide and its application culminated during the period of 1955 ~ 1964. The substance had been used as termitecides as a Soil-Residue-Prone Pesticide under the Agricultural Chemicals Regulation Law in 1971, but its registration under the Agricultural Chemicals Regulation Law was expired in FY1975. It had been used for termite control and was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in October 1981. Also the substance is one of the original twelve POPs covered by the Stockholm Convention.

In previous monitoring series until FY2001, the substance was monitored in wildlife (bivalves, fish and birds) during the period of FY1978  $\sim$  1996, FY1998, FY2000 and FY2001 under the framework of "the Wildlife Monitoring." Under the framework of "the Surface Water/Sediment Monitoring," the substance in surface water and sediment was monitored during the period of FY1986  $\sim$  1998 and FY1986  $\sim$  2001, respectively.

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water sediment wildlife (bivalves, fish and birds) and air in  $FY2002 \sim 2009$  and FY2011, in surface water wildlife (bivalves, fish and birds) and air in FY2014, and in sediment in FY2018.

No monitoring was conducted after FY2019. For reference, the monitoring results up to FY2018 are given below.

(Note) No monitoring was conducted in FY2010, FY2012 and FY2013.

<sup>(</sup>Note 2) \*2: There is no consistency between the results of the ornithological survey in FY2014 and those in previous years because of the changes in the survey sites and target species.

<sup>(</sup>Note 3) No monitoring was conducted in FY2010, FY2012 and FY2013.

## [6] DDTs (references)

· History and state of monitoring

DDT, along with hexachlorocyclohexanes (HCHs) and drins, was used as insecticides in high volume. Its registration under the Agricultural Chemicals Regulation Law was expired in FY1971. *p,p'*-DDT was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in October 1981. Also the substances are one of the original twelve POPs covered by the Stockholm Convention.

Among several DDT isomers with chlorine at various positions on the aromatic ring, not only p,p'-DDT and o,p'-DDT as active substances but also p,p'-DDE, o,p'-DDE, p,p'-DDD and o,p'-DDD as the environmentally degraded products of DDTs have been the target chemicals in monitoring series since FY1978.

In previous monitoring series, p,p'-DDT, p,p'-DDE and p,p'-DDD had been monitored in wildlife (bivalves, fish and birds) during the period of FY1978 ~ 2001 under the framework of "the Wildlife Monitoring." Under the framework of "the Surface Water/Sediment Monitoring," surface water and sediment had been the monitored media during the period of FY1986 ~ 1998 and FY1986 ~ 2001, respectively. Similarly, o,p'-DDT, o,p'-DDE and o,p'-DDD had been monitored in wildlife (bivalves, fish and birds) during the period of FY1978 ~ 1996 and in FY1998, FY2000 and FY2001 under the framework of "the Wildlife Monitoring."

Under the framework of the Environmental Monitoring, p,p'-DDT p,p'-DDE p,p'-DDD o,p'-DDT o,p'-DDE and o,p'-DDD have been monitored in surface water and sediment in FY2002  $\sim$  2010 FY2014 and FY2021, in wildlife (bivalves, fish and birds) in FY2002  $\sim$  2010 FY2013 FY2018 and FY2021, and air in FY2002  $\sim$  2010 FY2013 FY2015 FY2018 and FY2021.

No monitoring was conducted after FY2022. For reference, the monitoring results up to FY2021 are given below.

- Monitoring results until FY2021
- $\bigcirc$  p,p'-DDT, p,p'-DDE and p,p'-DDD
- <Surface Water>

- (Note 1) \*1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002  $\sim$  2009.
- (Note 2) \*2: There is no consistency between the results of the ornithological survey in FY2013 and those in previous years because of the changes in the survey sites and target species.

  (Note 3) No monitoring was conducted in FY2011, FY2012, FY2014 ~ 2017, FY2019 and FY2020.

<sup>(</sup>Note 1) \*: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived during FY2002 ~ 2009.

<sup>(</sup>Note 2) No monitoring was conducted during FY2011  $\sim 2013$  and FY2015  $\sim 2020.$ 

<sup>(</sup>Note 2) No monitoring was conducted during FY2011  $\sim$  2013 and FY2015  $\sim$  2020.

<Wildlife> Stocktaking of the detection of o,p'-DDT, o,p'-DDE and o,p'-DDD in wildlife (bivalves, fish and birds) during FY2002 ~ 2021

(Note) No monitoring was conducted in FY2011, FY2012, FY2014, FY2016, FY2017, FY2019 and FY2020.

#### [7] Chlordanes (references)

· History and state of monitoring

Chlordane was used as insecticides on a range of agricultural crops, but the registration of Chlordanes under the Agricultural Chemicals Regulation Law was expired in FY1968. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in September 1986 because of its properties such as persistency, since it had been used as termitecides for wood products such as primary processed timber, plywood and house. Also, *cis*-Chlordane and *trans*-Chlordane are one of the original twelve POPs covered by the Stockholm Convention.

Although manufactured Chlordanes have complicated compositions, Heptachlor, γ-Chlordane, Heptachlor epoxide, *cis*-Chlordane, *trans*-Chlordane, Oxychlordane (as a chlordane metabolite), *cis*-Nonachlor (not registrated as an Agricultural Chemical) and *trans*-Nonachlor (not registrated as an Agricultural Chemical) were the original target chemicals in monitoring series. Since FY1983, 5 of those 8 chemicals (*cis*-Chlordane, *trans*-Chlordane, Oxychlordane, *cis*-Nonachlor and *trans*-Nonachlor) have been the target chemicals owning to their high detection frequency in the FY1982 High-Precision Environmental Survey.

In previous monitoring series, Chlordanes had been monitored in wildlife (bivalves, fish and birds) during the period of FY1978 ~ 2001 under the framework of "the Wildlife Monitoring." Under the framework of "the Surface Water/Sediment Monitoring", *cis*-Chlordane, *trans*-Chlordane, *cis*-Nonachlor and *trans*-Nonachlor in surface water and sediment have been the monitored during the period of FY1986 ~ 1998 and FY1986 ~ 2001, respectively.

Under the framework of the Environmental Monitoring, cis-Chlordane trans-Chlordane Oxychlordane (as a Chlordane metabolite) cis-Nonachlor (not registrated as an Agricultural Chemical) and trans-Nonachlor have been monitored in surface water and sediment in FY2002  $\sim$  2013 FY2017 and FY2020, and in wildlife (bivalves, fish and birds) and air in FY2002  $\sim$  2013 FY2016 and FY2020.

No monitoring was conducted after FY2021. For reference, the monitoring results up to FY2020 are given below.

- Monitoring results until FY2020
- O cis-Chlordane and trans-Chlordane

(Note) No monitoring was conducted in FY2014, FY2015 and FY2017  $\sim$  2019.

## [8] Heptachlors (references)

#### · History and state of monitoring

Heptachlor and its metabolite, Heptachlor epoxide, used to kill soil insects and termites, heptachlor has also been used more widely to kill cotton insects, grasshoppers, other crop pests, and malaria-carrying mosquitoes. The substances were not registrated under the Agricultural Chemicals Regulation Law in FY1975. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in September 1986, since it includes the technical chlordane used as a termitecide. Also Heptachlors are one of the original twelve POPs covered by the Stockholm Convention.

In previous monitoring series before FY2001, Heptachlor and Heptachlor epoxide were measured in FY1982 (in surface water, sediment and fish) and in FY1986 (in air) under the framework of "the Environmental Survey and Monitoring of Chemicals."

Under the framework of the Environmental Monitoring, Heptachlor in surface water sediment wildlife (bibalves, fish and birds) and air had been monitored since FY2002, and *cis*-Heptachlor epoxide and *trans*-Heptachlor epoxide had also been monitored since FY2003, every year through FY2011. After FY2012, the substances have been monitored in surface water and sediment in FY2014 FY2017 and FY2020, and in wildlife (bivalves, fish and birds) and air in FY2012 FY2013 FY2015 FY2016 and FY2020.

No monitoring was conducted after FY2021. For reference, the monitoring results up to FY2020 are given below.

#### Monitoring results until FY2020

#### <Surface Water>

Stocktaking of the detection of Heptachlor, *cis*-Heptachlor epoxide and *trans*-Heptachlor epoxide in surface water during FY2002 ~ 2020

<sup>(</sup>Note 2) \*2: There is no consistency between the results of the ornithological survey after FY2013 and those in previous years because of the changes in the survey sites and target species.

<sup>(</sup>Note 3) No monitoring was conducted in FY2014 and FY2017  $\sim$  2019.

(Note) No monitoring was conducted in FY2014 and FY2017 ~ 2019.

## [9] Toxaphenes (references)

#### · History and state of monitoring

Toxaphenes are a group of organochlorine insecticides used on cotton, cereal grains, fruits, nuts, and vegetables and also it has also been used to control ticks and mites in livestock. No domestic record of manufacture/import of the substances was reported since those were historically never registrated under the Agricultural Chemicals Regulation Law. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in September 2002. Also, Toxaphenes are one of the original twelve POPs covered by the Stockholm Convention.

In previous monitoring series before FY2001, total amount of Toxaphenes was measured in FY1983 (in surface water and sediment) under the framework of "the Environmental Survey and Monitoring of Chemicals."

Under the framework of the Environmental Monitoring, Parlar-26 Parlar-50 and Parlar-62 have been monitored in surface water sediment and air in FY2003  $\sim$  2009 and FY2018, and in wildlife (bivalves, fish and birds) in FY2003  $\sim$  2009 FY2015 and FY2018.

No monitoring was conducted after FY2019. For reference, the monitoring results up to FY2018 are given below.

#### Monitoring results until FY2018

#### <Surface Water>

Stocktaking of the detection of Parlar-26, Parlar-50 and Parlar-62 in surface water during FY2003 ~ 2018

	Monitored	Geometric				Quantification	Detection I	Frequency
Parlar-26	year	mean	Median	Maximum	Minimum	[Detection] limit	Sample	Site

## [10] Mirex (references)

#### · History and state of monitoring

Mirex was developed as an organochlorine insecticide chemical in the United States, and it was also used as a fire retardant in plastics, rubber, and electrical goods. No domestic record of manufacture/import of the substance was reported since it was historically never registrated under the Agricultural Chemicals Regulation Law. The substance was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in September 2002. Also the substance is one of the original twelve POPs covered by the Stockholm Convention.

Before FY2001, the substance was measured in FY1983 (in surface water and sediment) under the framework of "the Environmental Survey and Monitoring of Chemicals."

Under the framework of the Environmental Monitoring, Mirex has been monitored in surface water sediment wildlife (bivalves, fish and birds) and air in FY2003 ~ 2009 FY2011 and FY2018.

No monitoring was conducted after FY2019. For reference, the monitoring results up to FY2018 are given below.

#### · Monitoring results until FY2018

#### <Surface Water>

Stocktaking of the detection of Mirex in surface water during FY2003 ~ 2018

(Note) No monitoring was conducted in FY2010 and FY2012  $\sim$  2017.

<sup>(</sup>Note 2) \*2: There is no consistency between the results of the ornithological survey in FY2018 and those in previous years because of the changes in the survey sites and target species.

<sup>(</sup>Note 3) No monitoring was conducted in FY2010 and FY2012 ~ 2017.

## [11] HCHs (references)

#### · History and state of monitoring

HCHs were used as pesticides, household insecticides, and termiticides, etc. Even after their registration under the Agricultural Chemicals Regulation Law was expired in FY1971, they continue to be used as termiticides and wood preservatives.  $\alpha$ -HCH,  $\beta$ -HCH, and  $\gamma$ -HCH (synonym: Lindane) were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants in May 2009. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010.

Among many HCH isomers,  $\alpha$ -HCH,  $\beta$ -HCH,  $\gamma$ -HCH (synonym: Lindane) and  $\delta$ -HCH have been monitored in surface water, sediment, wildlife (bivalves, fish and birds) and air.

Before FY2001, the substances were measured in FY1974 (in surface water, sediment and fish) under the framework of "the Environmental Survey and Monitoring of Chemicals."  $\alpha$ -HCH and  $\beta$ -HCH had been the target chemicals, and surface water and sediment had been the monitored media during the period of FY1986 ~ 1998 and FY1986 ~ 2001, respectively. Under the framework of the Wildlife Monitoring, the substances were monitored in wildlife (bivalves, fish and birds) during the period of FY1978 ~ 1996 and in FY1998, FY2000 and FY2001 ( $\gamma$ -HCH (synonym: Lindane) and  $\delta$ -HCH had not been monitored since FY1997 and FY1993, respectively.)

Under the framework of the Environmental Monitoring,  $\alpha$ -HCH and  $\beta$ -HCH in surface water sediment and wildlife (bivalves, fish and birds) have been monitored FY2002 ~ FY2017 FY2019 and FY2022. Since FY2003,  $\alpha$ -HCH and  $\beta$ -HCH in air and  $\gamma$ -HCH (synonym: Lindane) and  $\delta$ -HCH in surface water sediment wildlife (bivalves, fish and birds) and air have also been monitored.

No monitoring was conducted in FY2023. For reference, the monitoring results up to FY2022 are given below.

#### Monitoring results until FY2022

#### <Surface Water>

Stocktaking of the detection of Total $\alpha$ -HCH,  $\beta$ -HCH,  $\gamma$ -HCH(synonym: Lindane) and  $\delta$ -HCH in surface water during FY2002  $\sim$  2022

#### [12] Chlordecone (reference)

• History and state of monitoring (reference)

Chlordecone is a synthetic chlorinated organic compound, which was mainly used as an agricultural pesticide. No domestic record of manufacture/import of the substance was reported since it was historically never registrated under the Agricultural Chemicals Regulation Law. Chlordecone was adopted as a target chemical at the Fourth Meeting of the Conference of Parties (COP4) on Stockholm convention on Persistent Organic Pollutants in May 2009 and designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010.

As a continuous survey, the first survey was in FY2008. In the Initial Environmental Survey and the Detailed Environmental Survey etc. under the framework of the Environmental Survey and Monitoring of Chemicals after FY2002, the substance was monitored in air in FY2003.

Under the framework of the Environmental Monitoring, the substance was monitored in surface water sediment and wildlife (bivalves, fish and birds) in FY2008 FY2010 and FY201, and in air in FY2010 and FY2011.

No monitoring was conducted after FY2012. For reference, the monitoring results up to FY2011 are given below.

#### · Monitoring results until FY2011

## [13] Hexabromobiphenyls (reference)

#### · History and state of monitoring

Hexabromobiphenyls are industrial chemicals that have been used as flame retardans. Hexabromobiphenyls were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants in May 2009 and designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010.

As a continuous survey, the first survey was in FY2009. Under the framework of the Environmental Survey of Chemical Substances up to FY2001, the substance was monitored in surface water, sediment, wildlife (fish) and air in FY1989. Under the framework of the Initial Environmental Survey and the Detailed Environmental Survey etc. in the Environmental Survey and Monitoring of Chemicals after FY2002, the substance was monitored surface water and sediment in FY2003, in air in FY2004.

Under the framework of the Environmental Monitoring, the substances has been monitored in surface water in FY2009 FY2010 and FY2011, in sediment and wildlife (bivalves, fish and birds) in FY2009 FY2010 FY2011 and FY2015, and in air in FY2010 2011 and FY2015.

No monitoring was conducted after FY2016. For reference, the monitoring results up to FY2015 are given below.

## Monitoring results until FY2015

#### <Surface Water>

Stocktaking of the detection of Hexabromobiphenyls in surface water during FY2009 ~ 2011

#### <Air>

Stocktaking of the detection of Hexabromobiphenyls in air during FY2010 ~ 2015

Hexabromo		Geometric	•			Quantification	Detection I	Frequency
biphenyls	Monitored year	mean	Median	Maximum	Minimum	[Detection] limit	Sample	Site
	2010 Warm season	nd	nd	nd	nd	0.2 [0.1]	0/37	0/37
A :	2010 Cold season	nd	nd	nd	nd	0.3 [0.1]	0/37	0/37
Air	2011 Warm season	nd	nd	nd	nd	0.3 [0.1]	0/35	0/35
$(pg/m^3)$	2011 Cold season	nd	nd	nd	nd		0/37	0/37
	2015 Warm season	nd	nd	1.1	nd	0.06 [0.02]	2/35	2/35

(Note) No monitoring was conducted during FY2012 ~ 2014.

<sup>(</sup>Note 2) \*2: The sum value of the Quantification [Detection] limits of each congener in FY2009 and FY2010.

<sup>(</sup>Note 3) \*3: There is no consistency between the results of the ornithological survey in FY2015 and those in previous years because of the changes in the survey sites and target species.

<sup>(</sup>Note 4) No monitoring was conducted during FY2012 ~ 2014.

## [14] Polybromodiphenyl ethers ( $Br_4 \sim Br_{10}$ ) (reference)

#### · History and state of monitoring

Polybrominated diphenyl ethers have been used as flame retardants for plastics products. Tetrabromodiphenyl ethers, Pentabromodiphenyl ethers, Hexabromodiphenyl ethers, and Heptabromodiphenyl ethers were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants in May 2009. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010. Also, Decabromodiphenyl ether was adopted as target chemicals at the COP8 of the Stockholm convention on Persistent Organic Pollutants held from late April to early May 2017. The substance was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2018.

As a continuous survey, the first survey was in FY2008. Under the framework of the Environmental Survey of Chemical Substances up to FY2001, Decabromodiphenyl ether was monitored in surface water and sediment in FY1977 and FY1996, Polybromodiphenyl ethers ( $Br_6$ ,  $Br_8$  and  $Br_{10}$ ) were monitored in surface water, sediment and wildlife (fish) in FY1987 and FY1988, Polybromodiphenyl ethers ( $Br_1 \sim Br_7$ ) were monitored in air in FY2001. In the Initial Environmental Survey and the Detailed Environmental Survey etc. under the framework of the Environmental Survey and Monitoring of Chemicals after FY2002, Decabromodiphenyl ether was monitored in surface water, sediment and wildlife (fish) in FY2002, Polybromodiphenyl ethers ( $Br_6$ ,  $Br_8$  and  $Br_{10}$ ) were monitored in sediment and wildlife (fish) in FY2003, Pentabromodiphenyl ethers were monitored in sediment and Polybromodiphenyl ethers ( $Br_1 \sim Br_7$ ) in air in FY2004, Polybromodiphenyl ethers ( $Br_1 \sim Br_7$ ,  $Br_9$  and  $Br_{10}$ ) were monitored in surface water in FY2005.

Under the framework of the Environmental Monitoring, Polybromodiphenyl ethers (Br<sub>4</sub>  $\sim$  Br<sub>10</sub>) have been monitored in surface water sediment and air in FY2009  $\sim$  2012 FY2014  $\sim$  2019 and FY2022, and in wildlife (bivalves, fish and birds) in FY2008 FY2010  $\sim$  2012 FY2014  $\sim$  2019 and FY2022.

No monitoring was conducted in FY2023. For reference, the monitoring results up to FY2022 are given below.

#### Monitoring results until FY2022

# [15] Perfluorooctane sulfonic acid (PFOS)

## · History and state of monitoring

Perfluorooctane sulfonic acid (PFOS) has been used as electric and electronic parts, fire fighting foam, photo imaging, hydraulic fluids and textiles. Perfluorooctane sulfonic acid, its salts and perfluorooctane sulfonyl fluoride were adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants in May 2009, and designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010.

As a continuous survey, the first survey was in FY2008. Under the framework the Initial Environmental Survey and the Detailed Environmental Survey etc. in the Environmental Survey and Monitoring of Chemicals after FY2002, the substance was monitored in surface water in FY2002, sediment and wildlife (fish) in FY2003, air in FY2004, surface water, sediment and wildlife (bivalves and fish) in FY2005.

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water and sediment in FY2009  $\sim 2012$  FY2014  $\sim 2016$  and FY2018  $\sim 2023$ , in wildlife (bivalves, fish and birds) in FY2009  $\sim 2012$  FY2014  $\sim 2017$  and FY2019  $\sim 2023$ , and in air in FY2010  $\sim 2017$  and FY2019  $\sim 2023$ .

#### · Monitoring results

#### <Surface Water>

The presence of the substance in surface water was monitored at 47 sites, and it was detected at 43 of the 47 valid sites adopting the detection limit of 30 pg/L, and the detection range was up to 4,100 pg/L.

As results of the inter-annual trend analysis from FY2009 to FY2023, a reduction tendencies in specimens from lake areas and sea areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

Stocktaking of the detection of Perfluorooctane sulfonic acid (PFOS) in surface water during FY2009 ~ 2023

(Note) No monitoring was conducted in FY2013 and FY2017.

### <Sediment>

The presence of the substance in sediment was monitored at 60 sites, and it was detected at 58 of the 60 valid sites adopting the detection limit of 4 pg/g-dry, and the detection range was up to 660 pg/g-dry.

As results of the inter-annual trend analysis from FY2009 to FY2023, reduction tendencies in specimens from river mouth areas and sea areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in sediment was also identified as statistically significant.

<sup>(</sup>Note 1) \*: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2009.

## <Wildlife>

The presence of the substance in bivalves was monitored in 2 areas, and it was detected at 1 of the 2 valid areas adopting the detection limit of 3 pg/g-wet, and the detected concentration was tr(5) pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 17 of the 18 valid areas adopting the detection limit of 3 pg/g-wet, and the detection range was up to 4,900 pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 3 pg/g-wet, and the detected concentrations were 1,400 pg/g-wet and 100,000 pg/g-wet.

<sup>(</sup>Note 1) \*1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2009.

#### <Air>

The presence of the substance in air was monitored at 35 sites, and it was detected at all 35 valid sites adopting the detection limit of  $0.2 \text{ pg/m}^3$ , and the detection range was  $1.0 \sim 6.8 \text{ pg/m}^3$ .

As a result of the inter-annual trend analysis from FY2010 to FY2023, a reduction tendency in specimens was identified as statistically significant.

Stocktaking of the detection of Perfluorooctane sulfonic acid (PFOS) in air during FY2010 ~ 2023

(Note) No monitoring was conducted in FY2018.

<sup>(</sup>Note 2) \*2: There is no consistency between the results of the ornithological survey after FY2014 and those in previous years because of the changes in the survey sites and target species.

<sup>(</sup>Note 3) No monitoring was conducted in FY2013 and FY2018.

# [16] Perfluorooctanoic acid (PFOA)

#### · History and state of monitoring

Perfluorooctanoic acids (PFOA) have been used as water repellent agent, oil repellent agent and surface acting agent. PFOA, its salts and PFOA-related compounds were adopted as target chemicals at the COP9 of the Stockholm convention on Persistent Organic Pollutants held from late April to early May 2019. The substances were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2021.

As a continuous survey, the first survey was in FY2009. Under the framework of the Environmental Survey and Monitoring of Chemicals after FY2002, the Initial Environmental Survey and the Detailed Environmental Survey etc., the substance was monitored in surface water in FY2002, sediment and wildlife (fish) in FY2003, air in FY2004, surface water, sediment and wildlife (bivalves and fish) in FY2005.

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water and sediment in FY2009  $\sim 2012$  FY2014  $\sim 2016$  and FY2018  $\sim 2023$ , in wildlife (bivalves, fish and birds) in FY2009  $\sim 2012$  FY2014  $\sim 2017$  and FY2019  $\sim 2023$ , and in air in FY2010  $\sim 2017$  and FY2019  $\sim 2023$ .

#### · Monitoring results

#### <Surface Water>

The presence of the substance in surface water was monitored at 47 sites, and it was detected at all 47 valid sites adopting the detection limit of 30 pg/L, and the detection range was  $140 \sim 11,000 \text{ pg/L}$ .

As results of the inter-annual trend analysis from FY2009 to FY2023, reduction tendencies in specimens from river areas, lake areas and river mouth areas were identified as statistically significant and a reduction tendency in specimens from the overall areas in surface water was also identified as statistically significant.

Stocktaking of the detection of Perfluorooctanoic acid (PFOA) in surface water during FY2009 ~ 2023

Perfluorooctanoic	Monitored	Caamatnia				Quantification	Detection	Frequency

	2023	990	770	11,000	140	90 [30]	47/47	47/47

(Note) No monitoring was conducted in FY2013 and FY2017.

## <Sediment>

The presence of the substance in sediment was monitored at 60 sites, and it was detected at 57 of the 60 valid sites adopting the detection limit of 3 pg/g-dry, and the detection range was up to 410 pg/g-dry.

As results of the inter-annual trend analysis from FY2009 to FY2023, a reduction tendencies in specimens from river mouth areas was identified as statistically significant and a reduction tendency in specimens from the overall areas in sediment was also identified as statistically significant.

	2023	22	24	410	nd	7 [3]	57/60	57/60

<sup>(</sup>Note 1) \*: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2009.

#### <Wildlife>

The presence of the substance in bivalves was monitored in 2 areas, and it was detected at 1 of the 2 valid areas adopting the detection limit of 3 pg/g-wet, and the detected concentration was 13 pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 11 of the 18 valid areas adopting the detection limit of 3 pg/g-wet, and the detection range was up to 29 pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 3 pg/g-wet, and the detected concentrations were 66 pg/g-wet and 2,000 pg/g-wet.

As results of the inter-annual trend analysis from FY2009 to FY2023, although the number of detections was small, the detection rate of specimens from fish was decreased, it suggested a reduction tendency of the concentrations.

# [17] Pentachlorobenzene

#### · History and state of monitoring

Pentachlorobenzene have been used as used in PCB products, in dyestuff carriers, as a fungicide, a flame retardant and as a chemical intermediate e.g. previously for the production of quintozene. PeCB might still be used as an intermediate. PeCB is also produced unintentionally during combustion, thermal and industrial processes. It also present as impurities in products such as solvents or pesticides. It was historically never registered under the Agricultural Chemicals Regulation Law. The substance is produced as a by-product when agricultural chemicals are produced. In addition, it is generated unintentionally at the time of combustion. The substance was adopted as target chemicals at the COP4 of the Stockholm convention on Persistent Organic Pollutants in May 2009 and designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2010.

As a continuous survey to FY2001, undert the framework "the Wildlife Monitoring of Chemicals," the substance was monitored in wildlife (bivalves and fish) in FY1980, wildlife (bivalves, fish and birds) from FY1979 to FY1986, in FY1988, FY1990, FY1992, FY1996 and FY1999.

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water in FY2007 FY2010  $\sim$  2015 and FY2017  $\sim$  2022, in sediment in FY2007 and FY2010  $\sim$  2022, in sediment and wildlife (bivalves, fish and birds) in FY2007 and FY2010  $\sim$  2023, and in air in FY2007, FY2009  $\sim$  2023.

# · Monitoring results

#### <Wildlife>

The presence of the substance in bivalves was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 0.2 pg/g-wet, and the detected concentrations were 6.0 pg/g-wet and 6.1 pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at all 18 valid areas adopting the detection limit of 0.2 pg/g-wet, and the detection range was  $3.4 \sim 150$  pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 0.2 pg/g-wet, and the detected concentrations were 220 pg/g-wet and 380 pg/g-wet.

As results of the inter-annual trend analysis from FY2010 to FY2023, although the number of detections was small, the detection rate of specimens from the bivalves was decreased, it suggested a reduction tendency of the concentrations.

<sup>(</sup>Note 1) \*1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2007.

# <Air>

The presence of the substance in air was monitored at 35 sites, and it was detected at all 35 valid sites adopting the detection limit of  $0.08~pg/m^3$ , and the detection range was  $36\sim170~pg/m^3$ .

<sup>(</sup>Note 2) \*2: There is no consistency between the results of the ornithological survey after FY2013 and those in previous years because of the changes in the survey sites and target species.

<sup>(</sup>Note 3) No monitoring was conducted in FY2008 and FY2009.

## [18] Endosulfans (references)

#### · History and state of monitoring

Endosulfans had been used an insecticide that has been used since the 1950s to control crop pests, tsetse flies and ectoparasites of cattle and as a wood preservative. Endosulfans were adopted as target chemicals at the COP5 of the Stockholm convention on Persistent Organic Pollutants in Apri 2011. The substances were designated as Class I Specified Chemical Substances under the Chemical Substances Control Law in May 2014.

As a continuous survey, the first survey was in FY2011, under the framework of the Environmental Survey of Chemical Substances up to FY2001, the substance was monitored in surface water and sediment in FY1982 and air in FY1996.

Under the framework of the Environmental Monitoring, the substances have been monitored in surface water and sediment in FY2011 FY2012 FY2018 and FY2021 and wildlife (bivalves, fish and birds) in FY2011 FY2012 FY2014 FY2015 and FY2021, and in air in FY2011 FY2012 FY2014 ~ 2016 and FY2021.

No monitoring was conducted after FY2022. For reference, the monitoring results up to FY2021 are given below.

# [19] 1,2,5,6,9,10-Hexabromocyclododecanes (references)

#### · History and state of monitoring

1,2,5,6,9,10-Hexabromocyclododecanes have been used a flame retardant additive, providing fire protection during the service life of vehicles, buildings or articles, as well as protection while stored.  $\alpha$ -1,2,5,6,9,10-Hexabromocyclododecane,  $\beta$ -1,2,5,6,9,10-Hexabromocyclododecane and  $\gamma$ -1,2,5,6,9,10-Hexabromocyclododecane were adopted as target chemicals at the COP6 of the Stockholm convention on Persistent Organic Pollutants held from late April to early May 2013, and designated as a Class I Specified Chemical Substances under the Chemical Substances Control Law in May 2014.

As a continuous survey, the first survey was in FY2011, under the framework of the Environmental Survey of Chemical Substances up to FY2001, the substances were monitored in surface water, sediment and wildlife (fish) in FY1987. In the framework of the Environmental Survey and Monitoring of Chemicals after FY2002 under the Initial Environmental Survey and the Detailed Environmental Survey etc., the substance was monitored in surface water and sediment in FY2003, in wildlife (fish) in FY2004.

Under the framework of the Environmental Monitoring,  $\alpha$ -1,2,5,6,9,10-Hexabromocyclododecane  $\beta$ -1,2,5,6,9,10-Hexabromocyclododecane and  $\gamma$ -1,2,5,6,9,10-Hexabromocyclododecane have been monitored in surface water in FY2011 and FY2014, in sediment in FY2011 FY2012 FY2015 FY2016 and FY2022, in wildlife (bivalves, fish and birds) in FY2011 FY2012 FY2014 ~ 2019 and FY2022, and in air in FY2012 FY2014 ~ 2017 FY2019 and FY2022. Until 2015,  $\delta$ -1,2,5,6,9,10-Hexabromocyclododecane and  $\varepsilon$ -1,2,5,6,9,10-Hexabromocyclododecan had also been monitored.

No monitoring was conducted in FY2023. For reference, the monitoring results up to FY2022 are given below.

## Monitoring results until FY2022

<sup>(</sup>Note 1) \*: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2011.

<sup>(</sup>Note 2) No monitoring was conducted in FY2013 FY2014 and FY2017  $\sim$  2021. No monitoring of  $\delta$ -1,2,5,6,9,10-Hexabromocyclododecane and  $\varepsilon$ -1,2,5,6,9,10-Hexabromocyclododecane was conducted in FY2016.

<Wildlife>
Stocktaking of the detection of 1,2,5,6,9,10-Hexabromocyclododecanes in wildlife (bivalves, fish and birds) during FY2011 ~ 2022

- (Note 1) \*1: Arithmetic mean value was calculated for each point, from which the geometric mean value for all points was derived in FY2011.
- (Note 2) \*2: There is no consistency between the results of the ornithological survey after FY2014 and those in previous years because of the changes in the survey sites and target species.
- (Note 3) No monitoring was conducted in FY2013 FY2020 and FY2021. No monitoring of  $\delta$ -1,2,5,6,9,10-Hexabromocyclododecane and  $\varepsilon$ -1,2,5,6,9,10-Hexabromocyclododecane was conducted in FY2016  $\sim$  2019.

# [20] Total Polychlorinated Naphthalenes (Total PCNs) (references)

## · History and results of the monitoring

Polychlorinated Naphthalenes (PCNs) make effective insulating coatings for electrical wires and have been used as wood preservatives, as rubber and plastic additives, for capacitor dielectrics and in lubricants. The substances with over 3 chloric ions were designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in August 1979. And PCNs ( $Cl_2 \sim Cl_8$ ) was adopted as target chemicals at the COP7 of the Stockholm convention on Persistent Organic Pollutants in May 2015 and Dichloronaphthalenes designated as Class I Specified Chemical Substances under the Chemical Substances Control Law in April 2016.

In previous monitoring series, Polychlorinated Naphthalenes were monitored in wildlife (bivalves, fish and birds) during the period of FY1980  $\sim$  1985 FY1987 FY 1989 FY 1991 and FY 1993 under the framework of "the Wildlife Monitoring."

Under the framework of "the Environmental Monitoring", Polychlorinated Naphthalenes with over a chloric ions have been monitored in surface water in FY2008 FY2018 FY2019 and FY2021, in sediment in FY2008 FY2016  $\sim$  2019 and FY2021, in wildlife (bivalves, fish and birds) in FY 2006 FY2008 FY2015  $\sim$  2019 and FY2021, and in air in FY2008 FY2014 FY2016  $\sim$  2019 and FY2021.

No monitoring was conducted after FY2022. For reference, the monitoring results up to FY2021 are given below.

(Note 1) \*: The sum value of the Quantification [Detection] limits of each congener.

(Note 2) No monitoring was conducted in FY2009 ~ 2013, FY2015 and FY2020.

<sup>(</sup>Note 2) \* 2: The sum value of the Quantification [Detection] limits of each congener.

<sup>(</sup>Note 3) \*3: There is no consistency between the results of the ornithological survey after FY2015 and those in previous years because of the changes in the survey sites and target species.

<sup>(</sup>Note 4) No monitoring was conducted in FY2007, FY2009 ~ 2014 and FY2020.

#### [21] Hexachlorobuta-1,3-diene

#### · History and results of the monitoring

Hexachlorobuta-1,3-diene had been used as a solvent for other chlorine-containing compounds. The substance was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law on April 2005. The substance was listed under Annex A (Prohibit and/or eliminate) at the COP7 of the Stockholm convention on Persistent Organic Pollutants in May 2015 and Annex C (Reduce or eliminate releases from unintentionally produced) at the COP8 in April-May 2017

As a continuous survey, the first survey was in FY2007, under the framework of the Environmental Survey of Chemical Substances up to FY2002, the substance was monitored in surface wate and sediment in FY1981, under the framework of the Environmental Survey and Monitoring of Chemicals after FY2002, in the Initial Environmental Survey and the Detailed Environmental Survey etc., the substance was monitored in surface water and sediment in FY2007.

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water sediment and wildlife (bivalves, fish and birds) in FY2007 FY2013 and FY2020  $\sim$  2022, and in air in FY2015  $\sim$  2023.

#### · Monitoring results

<Air>

The presence of the substance in air was monitored at 35 sites, and it was detected at all 35 valid sites adopting the detection limit of 20 pg/m<sup>3</sup>, and the detection range was  $2,100 \sim 6,500 \text{ pg/m}^3$ .

As results of the inter-annual trend analysis from FY2005 to FY2023, an increasing tendency in specimens was identified as statistically significant. But an inter-annual trend was not found, as the result from FY2017 to FY2023.

Stocktaking of the detection of Hexachlorobuta-1,3-diene in air during FY2015 ~ 2023

# [22] Pentachlorophenol and its salts and esters (reference)

#### · History and state of monitoring

Pentachlorophenol was used as a herbicide, insecticide, fungicide, algaecide, disinfectant and as an ingredient in antifouling paint. Pentachlorophenol and its salts and esters were adopted as target chemicals at the COP7 of the Stockholm convention on Persistent Organic Pollutants in May 2015, and designated as Class I Specified Chemical Substances under the Chemical Substances Control Law in October 2016.

As a continuous survey, the first survey of Pentachlorophenol was in FY2015, under the framework of the Environmental Survey of Chemical Substances up to FY2007, the substance was monitored in surface water and sediment in FY1974 and FY1996, and under the framework of the Environmental Survey and Monitoring of Chemicals after FY2002, in the Initial Environmental Survey and the Detailed Environmental Survey etc., the substance was monitored in surface water in FY2005.

Under the framework of the Environmental Monitoring, Pentachlorophenol was monitored in surface water in FY2015. And Pentachlorophenol and Pentachloroanisole have been monitored in surface water and sediment in FY2017  $\sim$  2019, and in wildlife (bivalves, fish and birds) and air in FY2016  $\sim$  2019.

No monitoring was conducted after FY2020. For reference, the monitoring results up to FY2019 are given below.

#### [23] Short-chain chlorinated paraffins

#### · History and state of monitoring

Short-chain chlorinated paraffinsare are used primarily in metalworking applications and in polyvinyl chloride (PVC) plastics. Other uses are adhesives and sealants, leather fat liquors, plastics, and as flame retardants in rubber, textiles and polymeric materials. The substances were adopted as target chemicals at the COP8 of the Stockholm convention on Persistent Organic Pollutants in April-May 2017. And the substances whose content of chlorine is more than 48% of the total weight were designated as Class I Specified Chemical Substances under the Chemical Substances Control Law in April 2018.

Under the framework of the Initial Environmental Survey and the Detailed Environmental Survey etc., the substances were surveied in surface water, sediment and wildlife (fish) in FY2004 and in surface water, sediment and wildlife (bivalves and fish) in FY2005.

Under the framework of the Environmental Monitoring, the substances have been monitored in surface water and sediment in FY2017  $\sim$  2022, in wildlife (bivalves, fish and birds) in FY2016  $\sim$  2022 and in air in FY2016  $\sim$  2023.

The results of short-chain chlorinated paraffins are tentative values obtained in trials among various problems in the measurement method.

#### Monitoring results

#### <Wildlife>

Chlorinated decanes: The presence of the substance in bivalves was monitored in 2 areas, and it was detected at 1 of the 2 valid areas adopting the detection limit of 150 pg/g-wet, and the detected concentration was tr(150) pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 6 of the 18 valid areas adopting the detection limit of 150 pg/g-wet, and the detection range was up to tr(270) pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 150 pg/g-wet, and the detected concentrations were tr(410) pg/g-wet and 610 pg/g-wet.

Chlorinated undecanes: The presence of the substance in bivalves was monitored in 2 areas, and it was not detected at both valid areas adopting the detection limit of 500 pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was not detected at all 18 valid areas adopting the detection limit of 500 pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at 1 of the 2 valid areas adopting the detection limit of 500 pg/g-wet, and the detected concentration was tr(1,200) pg/g-wet.

Chlorinated dodecanes: The presence of the substance in bivalves was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 300 pg/g-wet, and the detected concentrations were tr(360) pg/g-wet and 1,000 pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 13 of the 18 valid areas adopting the detection limit of 300 pg/g-wet, and the detection range was up to 730 pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at both valid areas adopting the detection limit of 300 pg/g-wet, and the detected concentrations were 700 pg/g-wet and 1,300 pg/g-wet.

Chlorinated tridecanes: The presence of the substance in bivalves was monitored in 2 areas, and it was detected at 1 of the 2 valid areas adopting the detection limit of 500 pg/g-wet, and the detected concentration was tr(740) pg/g-wet. For fish, the presence of the substance was monitored in 18 areas, and it was detected at 7 of the 18 valid areas adopting the detection limit of 500 pg/g-wet, and the detection range was up to tr(730) pg/g-wet. For birds, the presence of the substance was monitored in 2 areas, and it was detected at 1 of the 2 valid areas adopting the detection limit of 500 pg/g-wet, and the detected concentration was 1,700 pg/g-wet.

Stocktaking of the detection of Chlorinated decanes, Chlorinated undecanes, Chlorinated dodecanes and Chlorinated tridecanes in wildlife (bivalves, fish and birds) during FY2016  $\sim 2023$

(Note) Chlorinated paraffins with  $5 \sim 9$  chlorines are target chemicals.

<Air>

Chlorinated decanes: The presence of the substance in air was monitored at 35 sites, and it was detected at all 35 valid sites adopting the detection limit of 40 pg/m $^3$ , and the detection range was tr(80)  $\sim$  940 pg/m $^3$ .

Chlorinated undecanes: The presence of the substance in air was monitored at 35 sites, and it was detected at 33 of the 35 valid sites adopting the detection limit of 190 pg/m³, and the detection range was up to 1,300 pg/m³.

Chlorinated dodecanes: The presence of the substance in air was monitored at 35 sites, and it was detected at 18 of the 35 valid sites adopting the detection limit of  $210 \text{ pg/m}^3$ , and the detection range was up to  $tr(520) \text{ pg/m}^3$ .

Chlorinated tridecanes: The presence of the substance in air was monitored at 35 sites, and it was detected at 15 of the 35 valid sites adopting the detection limit of 130 pg/m³, and the detection range was up to tr(250) pg/m³.

# [24] Dicofol (references)

#### · History and state of monitoring

Dicofol was used as insecticides and mites etc., but the registration of Chlordanes under the Agricultural Chemicals Regulation Law was expired in FY2004. The substance was designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in April 2005. The substance was adopted as a target chemical at the COP9 of the Stockholm convention on Persistent Organic Pollutants held from late April to early May 2019.

Under the framework of the Initial Environmental Survey and the Detailed Environmental Survey etc., the substance was surveied in sediment in FY2004.

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water and sediment in FY2008 FY2019 and FY2020, in wildlife (bivalves, fish and birds) in FY2006 FY2008 and FY2018  $\sim$  2020, and in air in FY2016 FY2019 and FY2020.

No monitoring was conducted after FY2021. For reference, the monitoring results up to FY2020 are given below.

## Monitoring results until FY2020

#### <Surface Water>

Stocktaking of the detection of Dicofol in surface water during FY2008 ~ 2020

	Monitored	Geometric	Geometric			Quantification	Detection 1	Frequency

 Λ:	2016 Warm season	nd	nd	1.0	nd	0.5 [0.2]	10/37	10/37
Air	2019 Warm season	nd	nd	0.4	nd	0.4 [0.2]	5/36	5/36
(pg/m <sup>3</sup> )	2020 Warm season	nd	nd	tr(0.3)	nd	0.5 [0.2]	3/37	3/37

(Note) No monitoring was conducted in FY2017 and FY2018.

<sup>(</sup>Note 2) \*2: There is no consistency between the results of the ornithological survey after FY2018 and those in previous years because of the changes in the survey sites and target species. (Note 3) No monitoring was conducted in FY2007 and FY2009  $\sim$  2017.

# [25] Perfluorohexane sulfonic acid (PFHxS)

## · History and state of monitoring

Perfluorohexane sulfonic acid (PFHxS) is used as Fluoropolymer processing aid and Surfactant etc. Perfluorohexane sulfonic acid (PFHxS), its salts and PFHxS-related compounds were adopted as target chemicals at the COP10 of the Stockholm convention on Persistent Organic Pollutants in June 2022. And the substances were designated as Class I Specified Chemical Substances under the Chemical Substances Control Law in December 2023.

Under the framework of the Environmental Survey of Chemical Substances up to FY2001 and in the Initial Environmental Survey and the Detailed Environmental Survey etc. under the framework of the Environmental Survey and Monitoring of Chemicals after FY2002, the substance was not monitored.

Under the framework of the Environmental Monitoring, the substance has been monitored in surface water and sediment in FY2018  $\sim$  FY2023, and in wildlife (bivalves, fish and birds) and air in FY2020  $\sim$  2023.

#### · Monitoring results

#### <Surface Water>

The presence of the substance in surface water was monitored at 47 sites, and it was detected at 38 of the 47 valid sites adopting the detection limit of 30 pg/L, and the detection range was up to 2,200 pg/L.

Stocktaking of the detection of Perfluorohexane sulfonic acid (PFHxS) in surface water during FY2018 ~ 2023

Perfluorohexane	Monitored	1 Geometric				Quantification	Detection Frequency	
sulfonic acid (PFHxS)		mean	Median	Maximum	Minimum	[Detection] Limit	Sample	Site

# [27] Dechlorane pluses

#### · History and state of monitoring

Dechlorane pluses were mainly used a flame retardant for electrical and electronic products, resins and rubber. The substances were adopted as target chemicals at the COP11 of the Stockholm convention on Persistent Organic Pollutants in May 2023 and designated as a Class I Specified Chemical Substance under the Chemical Substances Control Law in December 2024.

As a continuous survey, the first survey was in FY2023. Under the framework of the Environmental Survey of Chemical Substances up to FY2001, the substance was monitored in surface water, sediment and wildlife (fish) in FY1976.

Under the framework of the Environmental Monitoring, the substances have been monitored in surface water and sediment in FY2023.

## · Monitoring results

## <Surface Water>

anti-Dechlorane plus: The presence of the substance in surface water was monitored at 47 sites, and it was detected at 44 of the 47 valid sites adopting the detection limit of 0.7 pg/L, and the detection range was up to 410 pg/L.

syn-Dechlorane plus: The presence of the substance in surface water was monitored at 47 sites, and it was detected at 36 of the 47 valid sites adopting the detection limit of 0.9 pg/L, and the detection range was up to 1,100 pg/L.

Stocktaking of the detection of anti-Dechlorane plus and syn-Dechlorane plus in surface water in FY2023

anti-Dechlorane	Monitored	Geometric				Quantification	Detection	Frequency
plus	year	mean	Median	Maximum	Minimum	[Detection] Limit	Sample	Site

# Reference: Egg of Great Cormorants (egg yolk and white)

In the FY2023 monitoring survey, eggs of great cormorants were analyzed to check for the presence of 7 chemicals (groups): PCBs, Hexachlorobenzene, Perfluorooctane sulfonic acid (PFOS), Perfluorooctanoic acids (PFOA), Pentachlorobenzene, Short-chain chlorinated paraffins and Perfluorohexane sulfonic acid (PFHxS).

The eggs were taken around Koyaike pond\*. The results of the analysis in Table 1.

(Note) \*: The eggs were taken by Water and Air Division, Environment Department, Hyogo Prefectural Government and Green and Nature Section, Urban Transportation Department, Itami City.

Table 1 List of the detection values of egg of Great Cormorant

		Quantification	Egg of Grea	nt Cormorant	(Reposted) Adult of Great Cormorant *2	
No.	Target chemicals	[Detection]	Koyaike pon	d (Itami City)	Tikubushima	Riv.Tenjin
		Limits	Egg white	Egg yolk	Island, Lake Biwa	(Hokuei Town)
[1]	Total PCBs *1	12 [5]	16,000	14,000,000	380,000	63,000
[2]	НСВ	2.1 [0.8]	85	43,000	4,200	2,100
[15]	Perfluorooctane sulfonic acid (PFOS)	6 [3]	220	150,000	100,000	1,400
[16]	Perfluorooctanoic acids (PFOA)	8 [3]	20	3,900	2,000	66
[17]	Pentachlorobenzene	0.6 [0.2]	31	13,000	380	220
	Short-chain chlorinated paraffinsare					
	[23-1] Chlorinated decanes	450 [150]	nd	4,100	tr(410)	610
[23]	[23-2] Chlorinated undecanes	1,500 [500]	nd	nd	nd	tr(1,200)
	[23-3] Chlorinated dodecanes	700 [300]	nd	nd	700	1,300
	[23-4] Chlorinated tridecanes	1,200 [500]	nd	nd	nd	1,700
[25]	Perfluorohexane sulfonic acid (PFHxS)	7 [3]	17	5,900	230	56

<sup>(</sup>Note 1) \*1: The Quantification [Detection] limits were the sum of the Quantification [Detection] limits of each congener.

<sup>(</sup>Note 2) \*2: These values are previously mentioned in the main part but are mentioned here again to indicate the stage of life cycle of great cormorants from egg to adult.
