

# The EU Climate and Energy framework

**Towards a Paris agreement** 

#### The latest climate science

#### **IPPC 5**<sup>th</sup> Assessment Report – Key findings:

- Warming of the climate system is unequivocal
- Human influence on the climate system is clear
- Each of the last three decades has been successively warmer at the Earth's surface than any preceding decade since 1850
- Continued emissions of greenhouse gases will cause further warming and changes in all components of the climate system.
- Limiting climate change would require substantial and sustained reductions in greenhouse gas emissions which, together with adaptation, can limit climate change risks.

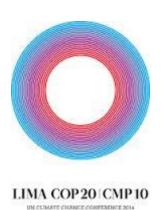

#### **Negotiations are progressing**

2012 2013 2014

- Doha Climate
   Gateway set out
   timetable for
   reaching a post 2020 agreement
- Kyoto Protocol 2<sup>nd</sup> commitment period agreed

 Agreement that INDCs should be submitted well in advance of Paris

 and by Q1
 2015 for those in a position to do so.

> Climate Action

- Elements of Paris agreement elaborated.
- Developed and developing countries pledged to Green Climate Fund

### **Towards Paris**

A new international climate agreement applicable to all to keep global average temperature increase below 2°C

#### **Durban 2011:**

launch of Durban "Mandate"

#### **Lima 2014**

Guidance on content of INDCs

#### Bonn, October 2015

#### Warsaw

2013: call for intended nationally determined contributions (INDCs) by March 2015

#### Paris 2015:

adoption of the new Agreement

#### The next few months are crucial

- Limited negotiating days left political will must be translated into progress in negotiations.
- INDCs from as many countries as possible should be submitted before Paris.
- Paris will be a test of global leadership, and of effective multilateralism.
- Citizens, businesses and investors are waiting for a strong signal of our long-term intent.

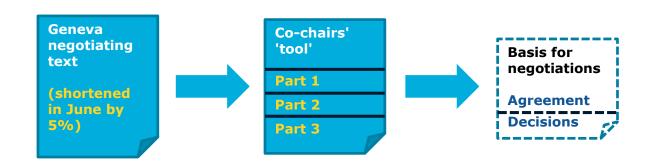

# Disconnect between political and negotiating levels remains – and must be resolved

- September session saw substantive discussions on the basis of the co-Chairs' 'tool' some new common ground emerged
- Request for co-Chairs to produce a new 'basis' non-paper
- Pre-2020 action, INDCs also discussed

Negotiators (final technical session 19-24 October)

Ministers, Leaders

- Informal ministerials in Paris; Pacific Islands Forum; Major Economies Forum; Petersberg Dialogue
- G7 and G20 Summits
- EU Summits, UNGA et al., Lima IMF/WB

# Overview of negotiating landscape

**Emissions** reductions

Adaptation, Loss and Damage Finance, technology and capacity building

INDCs (intended nationally determined contributions)

**Differentiation between countries** 

Transparency, accountability and dynamism

**Legal form and force of the Agreement** 

Technical work under the two subsidiary bodies

Enhancing pre-2020 action

# What might a robust agreement look like? A potential blueprint for tackling global climate change beyond 2020

- Long term goal
- Fair, ambitious and legally binding mitigation commitments for all Parties
- Dynamism 5-yearly reviews to increase ambition
- Robust common rules for transparency and accountability
- Climate resilient sustainable development
- Efficient and effective implementation and cooperation

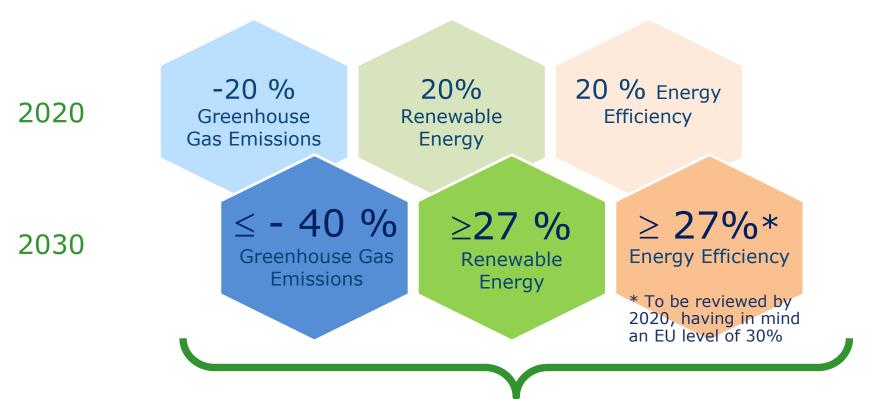

**The Paris Protocol** 

# 2030 Framework for Climate and Energy: the basis for the EU INDC

New governance system + indicators

## **Ambitious target but with large benefits**

A joined-up approach to 2030 helps

- ensure regulatory certainty for investors
- coordinate EU countries' efforts

Helps drive progress towards a low-carbon economy and build an energy system that

- ensures affordable energy for all consumers,
- increases the security of the EU's energy supplies,
- reduces our dependence on energy imports and
- creates new opportunities for growth and jobs.

It also brings **environmental and health benefits** – e.g. through reduced air pollution.

### Investments needed in the EU

Average annual additional investments of €38 billion for the EU 2011-30

**Fuel savings** will to a large extent compensate for these More than half of the investments are needed in the **residential and tertiary sectors** 

Lower-income countries need to make relatively larger efforts per GDP – but measures to enhance fairness and solidarity while ensuring overall efficiency in place between countries

**Energy system costs** do not differ substantially from the costs of renewing an ageing energy system, necessary in any case

Total cost of the energy system in 2030 projected to **increase** by 0.15% if targets are met cost-effectively

Overall there is a **shift** from operational costs (fuel) to **capital costs** (investments)

# EU International cooperation: delivering on finance commitments

The EU is a **leader in the provision of climate finance** for developing countries – over \$12bn in 2013 alone to support mitigation and adaptation

At least 20 per cent of the EU budget in the 2014-2020 period will be spent on climate-related projects and policies, in the EU and externally. EU development cooperation will contribute to achieving the 20 per cent overall commitment, with an estimated €14bn from this budget for climate spending in developing countries in the period 2014-2020.

**\$4.6bn from EU Member States** to the Green Climate Fund in addition to bilateral and multilateral funding, and a commitment to scale up private finance too.

EU-funded Global Climate Change Alliance supports 51 projects in 38 countries

## Thank you for your attention
