

## Concluded construction of overflow prevention measures for the leachate treatment at the final disposal site, utilizing the budget of Gorontalo Province.

### Overview

The Gorontalo provincial government had requested measures to address environmental pollution caused by inadequate treatment of leachate from the final disposal site and leachate leakage during rainfall since the project's start. Together with Ehime Prefecture, we proposed the installation of wastewater treatment plant by Aiken Kakoki K.K..

In 2025, the Gorontalo provincial government conducted a serious review of the implementation plan and secured a supplementary budget. Using this budget, construction to install control valves—as a measure to prevent overflow from existing treatment tanks during rainfall—was carried out in advance and completed in November 2025.

We plan to install the main treatment plant in the future using a combination of the provincial government budget and Japanese government subsidy.
