

A close-up photograph of a hand holding a small piece of bright green seaweed. The seaweed is being held just above a body of water, and a single drop of water is falling from its base, creating a series of concentric ripples on the water's surface. The background is a soft-focus view of the water and more seaweed, bathed in warm, golden light.

## Current situation of Seaweed in Japan

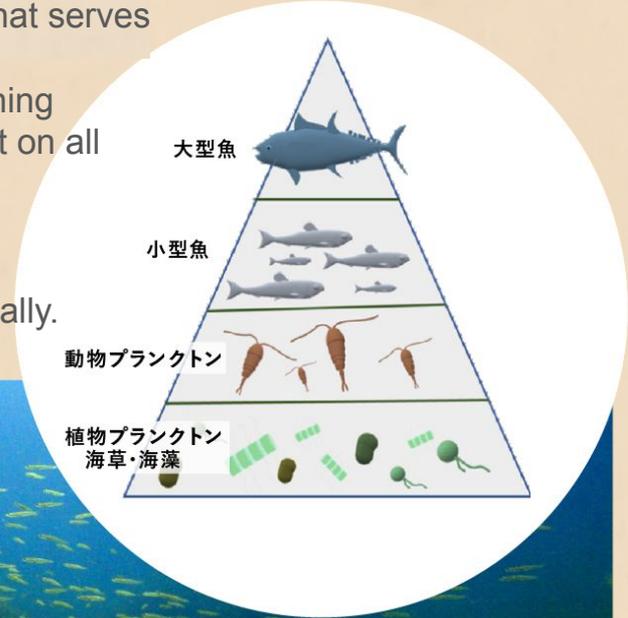

# Role of Seaweed beds

There exists an array of small creatures on the surfaces of the seaweed that serves as food for young fish.

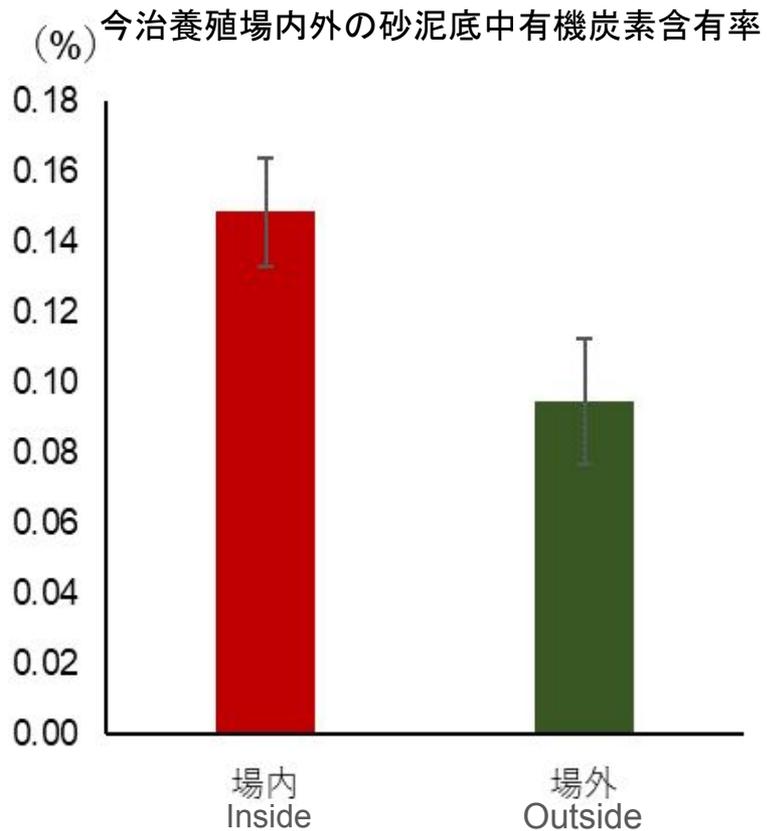

Species such as Ainame and squid will use the seaweed beds as a spawning ground, so the loss of the ocean cradle must bring upon a negative impact on all resources within the ocean.

It's difficult to grow seaweed on the seabed.

The only way is to create seaweed beds on the surface of the sea seasonally.
